Elaine J. Santino,2007-05-19 Past studies have been done on the effects specific foods have on the adrenal glands and other hormones This study is concerned with the combined effect that a well rounded healthy nutrient dense food program while eliminating the use of selected substances known to alter hormones such as alcohol caffeine soy hormone laced meat common allergy foods would have on the adrenal glands and specific hormones The investigator studied six individuals that had never been on hormone replacement therapy and were on a less than optimal diet One post menopausal woman four menstruating women and one male volunteered to be test subjects A salivary assay baseline was taken of the hormones cortisol dehydroepiandrosterone sulfate DHEA S testosterone progesterone and estradiol before they began the eight week dietary change Participants were given a list of approved foods and a list of foods during the eight week program They kept a detailed list of foods they consumed on a daily basis during the eight week program as well as the week prior to the study when they consumed their usual foods They reported in a detailed journal any changes in their energy drive bowel habits and mood changes At the end of eight weeks the same salivary assay was taken of the five hormones and the pre and post lab reports were evaluated There was an increase in testosterone for five of the subjects and a slight decrease in the one test subject that was not 100% compliant The male test subject was the only one that noted a substantial increase in drive in his journal Even though four of the women test participants also had a rise in testosterone levels they did not note an increase in their libido Fifty percent showed a healthy increase in 8 00 a m cortisol Four test participants began with erratic circadian

cortisol rhythms Of those four three showed a return to normal circadian rhythms on the post test With respect to weight and body mass index BMI 100% lost weight and had a drop in BMI There was no significant shift in DHEA S progesterone and estradiol in all six of the test participants Although the study period was short and there were only six participants there was an improvement in adrenal function an increase in testosterone and a positive shift in weight and body mass index A healthy well rounded nutrient dense food program can have a positive effect on the adrenal glands and the hormones they produce Further investigation needs to be done in this area to see the effects a nutrient dense diet would have on adrenal function and hormone production over a longer period of time and with a larger participant base **Own Your Body** David

**Neural Regulation of Metabolism** Qi Wu, Ruimao Zheng, 2018-11-02 This book systemically describes the mechanisms underlying the neural regulation of metabolism Metabolic diseases including obesity and its associated conditions currently affect more than 500 million people worldwide Recent research has shown that the neural regulation of metabolism is a central mechanism that controls metabolic status physiologically and pathophysiologically The book first introduces the latest studies on the neural and cellular mechanisms of hypothalamic neurons hypothalamic glial cells neural circuitries cellular signaling pathways and synaptic plasticity in the control of appetite body weight feeding related behaviors and metabolic disorders It then summarizes the humoral mechanisms by which critical adipocyte derived hormones and lipoprotein lipase regulate lipid and glucose metabolism and examines the role of the hypothalamus sympathetic nerve a critical nerve pathway from CNS to peripheral nervous system PNS in the regulation of metabolism in multiple tissues organs Furthermore the book discusses the functions of adipose tissue in energy metabolism Lastly it explores dietary interventions to treat neural diseases and some of the emerging technologies used to study the neural regulation of metabolism Presenting cutting edge developments in the neural regulation of metabolism the book is a valuable reference resource for graduate students and researchers in the field of neuroscience and metabolism

**Peptides in Energy Balance and Obesity** Gema Frühbeck, 2009 The aim of this book is to provide an updated detailed and comprehensive account of the field through a cutting edge analysis by leading experts in the area To achieve this the book is divided into three parts focusing on the peptides operating both centrally and peripherally at the same time as providing an integral and integrated perspective of the multifaceted and complex regulation of energy balance homeostasis Part I contains three chapters covering the central pathways involved in the control of food intake The first of these is devoted to the orexigenic neuropeptides i e those that increase or stimulate appetite while the second is a description of the peptides with anorexigenic effects i e those that decrease or stop food intake Since this is a rapidly evolving field the third chapter concentrates on emerging and newly identified factors and their interaction with the already well known peptides Part II encompasses six chapters that deal with the peripheral signals participating in energy homeostasis and their control in health and disease Regulation of body weight was once considered a simple feedback control system in which the

hypothalamus modulated food intake and energy expenditure to compensate for fluctuations in body weight The existing body of evidence has fostered the transition from the classic adipostat a sensor of body adiposity that informs the hypothalamus about the abundance of energy stores to a more dynamic and multifactorial model including signals emerging from several different organs such as the gut the liver the pancreas and the vascular system The underlying molecular mechanisms by which adipose tissue enlargement and the subsequent increase in adipokines contribute to the pathophysiological events in the gastrointestinal hepatic pancreatic musculoskeletal cardiovascular and immune systems are now beginning to be better understood and are covered in detail in this section of the book Part III contains six chapters providing an integrative approach to current knowledge in energy balance regulation Adipose tissue biology and the hierarchy of the neural circuitry controlling energy homeostasis deserve special attention as does the relevance of food reward signals and the links between the homeostatic and hedonic systems Specific chapters address the available advances in technology to analyse these complex issues including functional neuroimaging and the whole range of the omics strategies The final chapter takes a fresh and innovative look at future potential approaches to obesity management **Practical**
