 secure Hacking APIs is a crash course on web API security testing that will prepare you to penetration test APIs reap high
 rewards on bug bounty programs and make your own APIs more secure You ll learn how REST and GraphQL APIs work in the
 wild and set up a streamlined API testing lab with Burp Suite and Postman Then you ll master tools useful for reconnaissance
 endpoint analysis and fuzzing such as Kiterunner and OWASP Amass Next you ll learn to perform common attacks like those
 targeting an API s authentication mechanisms and the injection vulnerabilities commonly found in web applications You ll
 also learn techniques for bypassing protections against these attacks In the book s nine guided labs which target
 intentionally vulnerable APIs you ll practice Enumerating APIs users and endpoints using fuzzing techniques Using Postman
 to discover an excessive data exposure vulnerability Performing a JSON Web Token attack against an API authentication
 process Combining multiple API attack techniques to perform a NoSQL injection Attacking a GraphQL API to uncover a
 broken object level authorization vulnerability By the end of the book you ll be prepared to uncover those high payout API
 bugs other hackers aren t finding and improve the security of applications on the web USDA Forest Service General

SAN Boot Implementation and Best Practices Guide for IBM System Storage Sangam Racherla, Delmar

Demarchi, Scott Dybas, Bobby Stark, Mansoor Syed, IBM Redbooks, 2012-09-30 Booting servers from a storage area network SAN is being used increasingly in complex data center environments today due to its significant benefits over the traditional method of booting from local disks SAN Boot enables organizations to maximize consolidation of their IT resources minimize their equipment costs and realize the considerable management benefits of centralizing the boot process In SAN Boot you can deploy diskless servers in an environment where the boot disk is located on often RAID capable storage connected to the SAN The server initiator communicates with the storage device target through the SAN using the Fibre Channel host bus adapter HBA The system downtime is greatly minimized in case a critical component such as a processor memory or host bus adapter fails and needs to be replaced The system administrator needs to swap only the hardware and reconfigure the HBA s BIOS switch zoning and host port definitions on the storage server The system image still exists on the logical drive therefore the server is fully operational after the hardware swap and configuration change is completed This IBM Redbooks publication can help you with the SAN Boot implementation We present various SAN Boot scenarios using IBM System Storage products that include DS5000 DS8000 XIV and SVC The operating systems that are covered include Windows 2008 Red Hat Linux SUSE Linux and VMware
