

7. Position sensors

Position sensors inform the control unit when a gearchanging movement is completed. A gearchange can consist of max three movements:

- Neutral position - Confirmation
- Lateral stroke right/left - Confirmation
- Longitudinal stroke forward/rearward - Confirmation

In the range part there is also a gearchanging movement and a confirmation when changing between high and low in the splitter and range part.

The CAG gearbox has two different types of position sensors:

- Magnetic sensors on the gear selector housing of the main gearbox
- Confirmation switches for high and low gears.

Magnetic sensor

A magnetic sensor provides for non-mechanical gear confirmation of the main gearbox changing movements.

The confirmation part reacts to a magnetic field. It consists of two parts:

- A magnet housing
- A sensor housing

The magnet housing sits on top of the shift shaft. The electronic parts are encapsulated into the sensor housing. The locations of the sensors enable the control unit to read the positions. See also the section about the shift pattern in this booklet.
