

7. Válvulas de solenoide

Las válvulas de solenoide se controlan mediante señales procedentes de la unidad de mando y regulan el flujo de aire a los distintos cilindros de accionamiento.

Cuando finaliza el cambio de marcha, los sensores de posición informan a la unidad de mando. Entonces, la activación se detiene y la presión del cilindro de mando sale por la válvula de solenoide.

El sistema CS utiliza 7 válvulas de solenoide. Cinco de éstas se usan en la carrera longitudinal y lateral de la caja principal. 2 válvulas de solenoide se usan para la gama alta y baja de la unidad de gama.

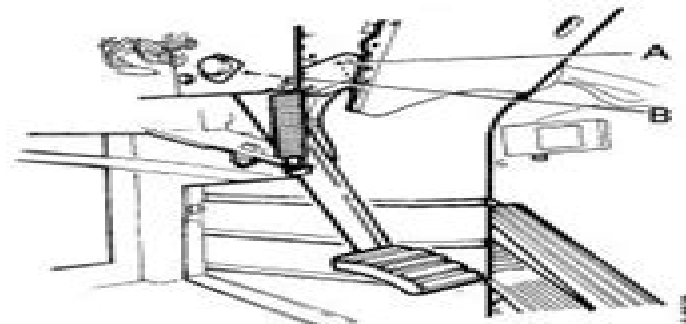

8. Interruptores del pedal del embrague

La posición del pedal del embrague se detecta por medio de 2 interruptores, uno superior y otro inferior:

- El interruptor superior detecta si el pedal del embrague no está pisado y la unidad de mando puede comprobar que el sensor de velocidad está funcionando. Cuando se pisa el pedal, el interruptor conecta a masa un relé que a su vez transmite una señal de +24 V a la unidad de mando.
- El interruptor del pedal del embrague inferior se cierra cuando el pedal del embrague está pisado a fondo. La unidad de mando detecta esta situación y activa las válvulas de solenoide correspondientes.

Los dos interruptores deben estar cerrados y el pedal pisado para poder realizar un cambio de marcha.

Interruptor del pedal del embrague

A = Interruptor superior

B = Interruptor inferior
