The Frankencamera Eino-Ville Aleksi Talvala, 2011 Digital cameras both in traditional form factors and as parts of cell phones have become ubiquitous over the last decade But for the most part they remain black boxes to the end user and cannot be reprogrammed or modified This has become an obstacle to researchers in the new field of computational photography who want to use the growing computing power of digital cameras to create images no traditional camera could produce This dissertation presents the Frankencamera platform a digital camera system designed for computational photography The Frankencamera is a fully open fully programmable digital camera which can be easily modified to test out new research ideas The Frankencamera architecture allows for per frame control of the capture process and accurate synchronization of all the components that make up the camera Based on this architecture this dissertation details two hardware platforms the F2 a flexible custom built camera and the Nokia N900 a commercial smartphone Both platforms can be easily programmed at a high level using the FCam API written to embody the Frankencamera architecture Finally this dissertation presents several sample applications for the Frankencamera platform Several of these applications could not have been developed for any

existing camera platform and the ease and speed at which they were written show that the Frankencamera platform is a compelling tool for computational photography

Monitoring the Performance and Operation of Cellular Radio Interfaces using Professional Measurement Tools. Baldomero Coll-Perales, Miguel Sepulcre Ribes, Javier Gozalvez Sempere, 2014-11-11

El presente libro ha sido diseñado para ayudar a los estudiantes del Grado en Ingeniería de Tecnología de Telecomunicaciones en el empleo de las herramientas utilizadas en las prácticas de las asignaturas de comunicaciones móviles y para mostrarles cómo analizar y entender los resultados que se obtienen con dichas herramientas. Para ello, en primer lugar, el libro describe de forma didáctica cómo utilizar las herramientas de medida profesionales empleadas en las prácticas de comunicaciones móviles en la UMH. Dichas herramientas se emplean habitualmente por ingenieros de planificación radio para monitorizar en tiempo real el rendimiento de las redes de comunicaciones móviles mediante drive tests. Dicha descripción incluye una presentación detallada de la herramienta de testeo profesional Nemo Handy desarrollada por Anite. Dicha herramienta se incluye en un terminal celular en modo ingeniería empleado para monitorizar en tiempo real el funcionamiento y rendimiento de las redes celulares y tomar medidas para su posterior análisis. Dicho análisis se realiza empleando la herramienta Nemo Outdoor descrita con detalle también en el libro, incluyendo ejemplos sobre cómo realizar los procesos más relevantes. Finalmente, el libro incluye y analiza una serie de medidas que se han realizado en un sistema celular UMTS HSDPA en activo en Elche. En particular, se explica el proceso seguido para realizar dichas medidas empleando Nemo Handy y se analizan mediante Nemo Outdoor las principales funcionalidades de un sistema celular como el establecimiento y finalización de llamadas, la selección y re-selección de celdas, el traspaso y el análisis de las descargas de datos y parámetros radio.

This book has been designed to guide the students of the Bachelor's in Telecommunications Technology Engineering towards a clear understanding of how to use the laboratory tools and show them how to analyze and understand the collected measurements. In this context, the book first introduces and describes how to use the professional measurement tools employed in the laboratory activities of the mobile communications course at UMH. These tools are commonly used by cellular radio engineers to monitor in real time the performance of cellular networks through drive tests. The book first presents the Nemo Handy professional measurement testing tool developed by Anite. This tool is included in an engineering mode cellular handset used to monitor in real time the operation of cellular networks and collect measurements for post processing. Such processing is done using the Nemo Outdoor tool that is also introduced in the book, including examples of how to perform the most relevant processing actions. Finally, this book shows how to conduct some measurement and analysis processes using Nemo Handy and Nemo Outdoor. The measurements have been conducted over live UMTS and HSDPA networks in the city of Elche and cover the analysis of important cellular functionalities like establishment and release of a call, cell selection and reselection, handovers and analysis of data downloads and cellular parameters. This chapter shows with practical examples how to conduct the measurements using Nemo Handy and how to interpret with Nemo Outdoor the
