Huie, 1842 *Poems* James Montgomery, 1870 Efficient Memoization Algorithms for Query Optimization: Top-Down Join Enumeration Through Memoization on the Basis of Hypergraphs Pit Fender, 2014-12

For a DBMS that provides support for a declarative query language like SQL the query optimizer is a crucial piece of software. The declarative nature of a query allows it to be translated into many equivalent evaluation plans. The process of choosing a suitable plan from all alternatives is known as query optimization. The basis of this choice are a cost model and statistics over the data. Essential for the costs of a plan is the execution order of join operations in its operator tree since the runtime of plans with different join orders can vary by several orders of magnitude. An exhaustive search for an optimal solution over all possible operator trees is computationally infeasible. To decrease complexity the search space must be restricted. Therefore a well accepted heuristic is applied. All possible bushy join trees are considered while cross products are excluded from the search. There are two efficient approaches to identify the best plan bottom up and top down join enumeration. But only the top down approach allows for branch and bound pruning which can improve compile time by several orders of magnitude while still preserving optimality. Hence this book focuses on the top down join enumeration. In the first part we present two efficient graph partitioning algorithms suitable for top down join enumeration. However as we will see there are two severe limitations. The proposed algorithms can handle only 1 simple binary join predicates and 2 inner joins. Therefore the second part adopts one of the proposed partitioning strategies to overcome those limitations. Furthermore we propose a more generic partitioning framework that enables every graph partitioning algorithm to handle join predicates involving more than two relations and outer joins as well as other non inner joins. As we will see our framework is more efficient than the adopted graph partitioning algorithm. The third part of this book discusses the two branch and bound pruning strategies that can be found in the literature. We present seven advancements to the combined strategy that improve pruning 1 in terms of effectiveness 2 in terms of robustness and 3 most importantly avoid the worst case behavior otherwise observed. Different experiments evaluate the performance improvements of our proposed methods. We use the TPC H TPC DS and SQLite test suite benchmarks to evaluate our joined contributions. As we show the average compile time improvement in those settings is 100% when compared with the state of the art in bottom up join enumeration. Our synthetic workloads show even higher improvement factors.
