 , 1994-07 *Data-driven Modelling of Wind Farm Flow Control Strategies* Nassir Cassamo, Jan-Willem van  
 Wingerden, 2025-03-18 This book presents data driven algorithms used in the context of wind farm modelling and exploits  
 their relation with concepts from non linear dynamical system theory. The algorithms include Input Output Dynamic Mode  
 Decomposition and their combination with the Koopman Operator theory. The latter improves on modelling and analysis of  
 the aerodynamic interaction between wind turbines in wind farms and assists in uncovering insights into the existing  
 dynamics and improves models accuracy. The authors introduce the topic of wind farm flow control illustrating current  
 strategies devised to overcome power losses in wind plants due to the aerodynamic interaction between turbines. Although  
 controlling wind farms as a whole is becoming increasingly important the high dimensions and governing non linear

dynamics inherent of wind farm systems make the design of numerical optimal controllers computationally expensive This book describes a possible pathway to circumvent this challenge through reduced order models that can embed the existing non linearities The authors make use of high fidelity open source simulation datasets and developed algorithms to fully show the potential of this approach using visual results The reader is motivated to use the datasets and algorithms and exploit the potential of the reduced order models
