REPLACEMENT AND COLLIMATION OF THE MIRRORS

For Sears Reflector Telescopes

This reflector has a concave mirror—main and a plane mirror—diagonal—. The main or concave mirror focuses the light rays coming from the object being viewed. The light rays, after they are collected by the main mirror, are then directed to a diagonal mirror where they are turned at right angles and focused to a point in the eyepiece tube of your telescope.

This small point of light is then magnified by the eyepiece. For this reason it is very important that both mirrors are in proper alignment for best results.

When your telescope is in need of mirror replacement and collimation (mirror alignment) follow these procedures carefully. These procedures should be done with the assistant or another person. If this is not possible, then assemble the telescope and adjust the tripod up to a comfortable height.
