

(2) Timing Control Valve (TCV)

The timing control valve (hereafter referred to as "TCV"), which is mounted on the injection pump, opens and closes the fuel passage between the high-pressure and low-pressure chambers of the timer piston in accordance with the signals from the computer.

When current is applied to the coil, the stator core becomes magnetized and retracts the moving core by compressing the spring. As a result, the fuel passage opens.

The opening of the valve is controlled by the computer in accordance with the ratio of the ON/OFF times (duty cycle ratio) of the current that is applied to the coil. The longer the length of the ON time, the longer the valve remains open.

5-3. Injection Timing Control

(1) Injection Timing Control Method

The injection timing is determined by the valve opening time of the TCV that regulates the pump chamber fuel pressure (that is applied to the timer piston) and by moving the roller ring to effect control.

The longer the valve opening time of the TCV, the greater the volume of fuel that bypasses from the high-pressure side of the timer piston to the low-pressure (suction) side. Therefore, the spring force moves the timer piston in the retard direction.

When the valve opening time of the TCV is short, the timer piston moves in the advance direction.
