Ocean Circulation And Climate:

Ocean Circulation and Climate Carl Wunsch, Patrick Heimbach, 2013-10-22 The World Ocean Circulation Experiment drove the development of estimates of the decadal scale time evolving general circulation that are dynamically and kinematically consistent. A long timescale and a goal of estimation rather than prediction preclude the use of meteorological methods called data assimilation. DA Instead state estimation methods are reviewed here and distinguished from DA. Results from the dynamically consistent family of solutions from the project Estimating the Circulation and Climate of the Ocean based upon least squares Lagrange multipliers adjoints are used to discuss the determination of the dominant elements of the circulation in the period since 1992 which marked the beginning of the satellite altimetric record. Significant changes documented in the Arctic in recent decades now mandate consideration of the coupled ocean cryospheric state. *Ocean Circulation and Climate* Gerold Siedler, John Church, John Gould, William John Gould, 2001-04-11 This book presents the views of leading scientists on the knowledge of the global ocean circulation following the completion of the observational phase of the World Ocean Circulation Experiment WOCE. In situ physical and chemical measurements together with satellite altimetry have produced a data set which provides for development of ocean and coupled ocean atmosphere circulation models used for understanding ocean and climate variability and projecting climate change. This book guides the reader through the analysis interpretation modelling and synthesis of this data. **Ocean Circulation and Climate** ,1997

Ocean Circulation and Climate Shiro Imawaki, Amy S. Bower, Lisa Beal, Bo Qiu, 2013-10-22 Strong persistent currents along the western boundaries of the world's major ocean basins are called western boundary currents WBCs. This chapter describes the structure and dynamics of WBCs their roles in basin scale circulation regional variability and their influence on atmosphere and climate. WBCs are largely a manifestation of wind driven circulation they compensate the meridional Sverdrup transport induced by the winds over the ocean interior. Some WBCs also play a role in the global thermohaline circulation through inter gyre and inter basin water exchanges. After separation from the boundary most WBCs have zonal extensions which exhibit high eddy kinetic energy due to flow instabilities and large surface fluxes of heat and carbon dioxide. The WBCs described here in detail are the Gulf Stream Brazil and Malvinas Currents in the Atlantic the Somali and Agulhas Currents in the Indian and the Kuroshio and East Australian Current in the Pacific Ocean. **Ocean Circulation and Climate** Thomas F. Stocker, 2013-10-22 A broad perspective of the ocean as a key component of the Earth System and of its role in the past present and future climate change is provided. The ocean is a huge reservoir of heat mass carbon and many other quantities and their estimated exchange fluxes suggest characteristic timescales of adjustment ranging from decades to many thousands of years. Surface patterns and meridional fluxes of these quantities highlight the important role of the wind driven circulation and the deep ocean flow systems through all ocean basins. Ocean dominated phenomena of natural variability in particular associated with the tropical oceans are explained. The relevance of the ocean circulation for abrupt

climate change as recorded from a variety of paleoclimate records is discussed This includes the bipolar seesaw concept which explains many features of interhemispheric response during the sequence of rapid warmings in the past ice age Finally the ocean's role during the anthropocene the time epoch which is dominated by the human caused increase in greenhouse gases to levels unprecedented in the past 800 000 years is explored Both the warming and the increase in atmospheric transport of water polewards create conditions for the ocean that may induce large and irreversible changes in the Atlantic meridional overturning circulation

Ocean Circulation and Climate Stephen R. Rintoul, Alberto C. Naveira Garabato, 2013-10-22 The Southern Ocean circulation connects the ocean basins as well as the upper and deep layers of the ocean As a result the region has a profound influence on the global ocean circulation and climate The Antarctic Circumpolar Current and the overturning circulation are dynamically linked through interactions between the mean flow eddies topography air sea forcing and mixing and stirring by small and mesoscale processes A new

dynamical paradigm is emerging that emphasizes the fully three dimensional nature of the circulation including the localization of meridional and vertical exchange of momentum vorticity and tracers by interactions between the flow and topography Changes observed in the Southern Ocean in recent decades have implications for global climate and provide insight into the response of the Southern Ocean circulation to changes in forcing *Ocean Circulation and Climate* Gerold Siedler, Stephen M. Circulation and Climate Ben P. Kirtman, Tim Stockdale, Robert Burgman, 2013-10-22 This chapter summarizes the scientific basis for and the current status of seasonal to interannual prediction with particular emphasis on the role of the tropical oceans The first part of the chapter focuses on oceanic sources of predictability in the tropical Pacific Atlantic and Indian Oceans Seasonal to interannual predictability issues in the Northern Hemisphere extratropics are also discussed Mechanisms that limit predictability particularly for ENSO are highlighted The second part of the chapter describes the forecast quality and procedures in practice today Finally the concluding remarks identify some outstanding challenges **Ocean**

Circulation and Climate Swadhin Behera, Peter Brandt, Gilles Reverdin, 2013-10-22 The tropical oceans play important roles in the global climate system through ocean transports of heat and freshwater as well as ocean atmosphere interactions The developments in observational networks during recent decades have helped us to quantify the strength and variability of most of the ocean general circulations responsible for the transports Those are discussed in detail in individual sections covering each tropical basin separately with a special emphasis on recent research results Shallow overturning cells observed in all three tropical basins as well as the deep Atlantic meridional overturning circulation are such examples that are linked to ocean and climate variations on multiple timescales In addition tropical ocean atmosphere interactions associated with oceanic planetary waves cause large scale climate variations such as El Niño Southern Oscillation ENSO Indian Ocean Dipole Atlantic Niño and ENSO Modoki Recent advances in numerical modeling augmented by in situ and satellite observations are helping the research community to understand ocean process and to predict associated climate variations on seasonal to longer timescales **Ice Drift, Ocean Circulation and Climate Change** Jens Bischof, 2000-11

The issue of global warming and climate change is of continuous concern. Since the 1970s it has been shown that the pack ice around the Arctic Ocean is thinning, the margin of permafrost is moving north, and the vegetation in the high northern parts of the world is changing. The greening of the Arctic: But are these changes the result of human activity or simply regular variations of the Earth's climate system? Over thousands of years a continuous archive of iceberg and sea ice drift has formed in the deep sea sediments, revealing the place of the ice's origin and allowing a reconstruction of the surface currents and the climate of the past. However, the drift of floating ice from one place to another is not just a passive record of past ocean circulation. It actively influences and changes the surface ocean circulation, thus having a profound effect on climate change.

Ice Drift, Ocean Circulation and Climate Change is the first book to focus on the interactions between ice, the ocean, and the atmosphere, and to describe how these three components of the climate system influence each other. It makes clear the positive contribution of paleoclimatology and paleoceanography and should be read by anyone concerned with global warming and climate change.

Ocean Circulation Andreas Schmittner, John C. H. Chiang, Sidney R. Hemming, 2013-05-02
Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 173. The ocean's meridional overturning circulation (MOC) is a key factor in climate change. The Atlantic MOC, in particular, is believed to play an active role in the regional and global climate variability. It is associated with the recent debate on rapid climate change, the Atlantic Multi-Decadal Oscillation (AMO), global warming, and Atlantic hurricanes. This is the first book to deal with all aspects of the ocean's large-scale meridional overturning circulation and is a coherent presentation from a mechanistic point of view of our current understanding of paleo-present-day and future variability and change. It presents the current state of the science by bringing together the world's leading experts in physical, chemical, and biological oceanography, marine geology, geochemistry, paleoceanography, and climate modeling. A mix of overview and research papers makes this volume suitable not only for experts in the field but also for students and anyone interested in climate change and the oceans.

Ocean Circulation and Climate Sybren S. Drijfhout, David P. Marshall, Henk A. Dijkstra, 2013-10-22. Conceptual models are a vital tool for understanding the processes that maintain the global ocean circulation, both in nature and in complex numerical ocean models. In this chapter we provide a broad overview of our conceptual understanding of the wind-driven circulation, the thermohaline circulation, and their transient behavior. While our conceptual understanding of the time-mean wind-driven circulation is now fairly mature, basic questions remain regarding the thermohaline circulation, for example, surrounding its overall strength and stability. Similarly, basic questions remain regarding the transient adjustment and internal variability of the ocean circulation.

Ocean Circulation Rui Xin Huang, 2010. The interaction between ocean circulation and climate change has been an active research frontier in Earth sciences in recent years. Coupled climate models consist of atmosphere ocean land and sea ice components Most climate models now do not need to use flux adjustments to maintain the present day climate in a control run when the forcings have a repeating annual cycle or are constant in time A control run must simulate well known important large scale phenomena such as the El Nino Southern Oscillation and the North Atlantic overturning circulation Climate models are used to simulate the climate of the twentieth century and to make projections of the future climate The uses and limitations of climate models are then described and several cutting edge issues are discussed **Ocean Circulation** Rui Xin Huang,2010
