9. Explain the function of the coolant filter in a cooling system. How does it remove impurities? (5 marks)

10. Discuss the importance of the coolant pump in a cooling system. How does it maintain the flow of coolant? (5 marks)

ANSWER

1. The design of the cooling system is crucial for the engine's performance and longevity. It ensures that the engine operates at an optimal temperature, preventing overheating and reducing wear. A well-designed cooling system also helps in maintaining the engine's efficiency and fuel economy.

2. The water pump is a mechanical device that circulates the coolant throughout the engine and the radiator. It is driven by the engine's belt system. The pump creates a pressure differential that forces the coolant to flow in a continuous loop.

3. The main components of a cooling system are the water pump, thermostat, radiator, fan, and coolant. The water pump circulates the coolant, the thermostat regulates the flow, the radiator dissipates heat, the fan assists in the cooling process, and the coolant absorbs and transfers heat.

4. The thermostat is a valve that opens and closes based on the engine's temperature. It prevents the coolant from circulating until the engine has reached its operating temperature, which helps in warming up the engine quickly and efficiently.

5. The radiator is a heat exchanger that transfers the heat from the coolant to the air. It consists of a series of tubes and fins. The fan blows air over the fins, which helps in dissipating the heat.

6. The fan is a mechanical device that is driven by the engine's belt system. It blows air over the radiator, which helps in dissipating the heat. The fan is essential for maintaining the engine's temperature, especially in high-traffic situations.

7. The coolant is a liquid that absorbs heat from the engine and transfers it to the radiator. It is a mixture of water and antifreeze. The coolant's boiling point is higher than water's, which prevents it from evaporating and losing its ability to absorb heat.

8. The coolant level is critical for the engine's performance. If the level is low, the engine may overheat, leading to increased wear and potential failure. Regularly checking and maintaining the coolant level is essential for the engine's longevity.

9. The coolant filter is a device that removes impurities from the coolant. It is located between the water pump and the radiator. The filter helps in maintaining the coolant's purity, which is essential for its ability to absorb and transfer heat.

10. The coolant pump is a mechanical device that circulates the coolant throughout the engine and the radiator. It is driven by the engine's belt system. The pump creates a pressure differential that forces the coolant to flow in a continuous loop.
