Periodic Trends

Can the properties of an element be predicted using a periodic table?

Why?

The periodic table is often considered to be the "best friend" of chemists and chemistry students alike. It includes information about atomic masses and element symbols, but it can also be used to make predictions about atomic size, electronegativity, ionization energies, bonding, solubility, and reactivity. In this activity you will look at a few periodic trends that can help you make those predictions. Like most trends, they are not perfect, but useful just the same.

1. Consider the data in Model 1 on the following page.

a. Each element has three numbers listed under it. Which value represents the atomic radius?

The first number under the Electron Shell Diagram

b. What are the units for the atomic radius?

pm - picometer

c. Write a complete sentence to convey your understanding of atomic radius. Note: You may not use the word "radius" in your definition.

The distance between the nucleus and the valence electrons of the atom.

2. In general, what is the trend in atomic radius as you go down a group in Model 1? Support your answer, using examples from three groups.

Atomic radius decreases as you go down a group (vertical column).
Grp #1 Li-152, Na-186, K-227 Grp #2 Ne-70, Ar-98, Kr-112
Grp #3 Be-112, Mg-160, Ca-197

3. Using your knowledge of Coulombic attraction and the structure of the atom, explain the trend in atomic radius that you identified in Question 2. *Hint:* You should discuss either a change in distance between the nucleus and outer shell of electrons or a change in the number of protons in the nucleus.

* *As you go down a group, the greater the distance between the nucleus and valence electrons, the smaller the attractive force.*

4. In general, what is the trend in atomic radius as you go across a period (left to right) in Model 1? Support your answer, using examples from two periods.

The general trend is atomic radius decreases in a period (horizontal row) moving left to right.

Grp #2 Ne-70, Mg-160, Al-143, Si-117, P-115, S-104, Cl-99, Ar-98

5. Using your knowledge of Coulombic attraction and the structure of the atom, explain the trend in atomic radius that you identified in Question 4.

As you move to the right across a period, protons are added to the nucleus. The greater number of protons increases the attractive force on the valence electrons. This decreases the atomic radius.

Energetics of Organometallic Species José A. Martinho Simões,2012-12-06 An overview of modern organometallic thermochemistry made by some of the most active scientists in the area is offered in this book The contents correspond to the seventeen lectures delivered at the NATO ASI Energetics of Organometallic Species Curia Portugal September 1991 plus three other invited contributions from participants of that summer school These papers reflect a variety of research interests and discuss results obtained with several techniques It is therefore considered appropriate to add a few preliminary words attempting to bring some unity out of that diversity In the first three chapters results obtained by classical calorimetric methods are described Modern organometallic thermochemistry started in Manchester with Henry Skinner and his pioneering work is briefly surveyed in the first chapter The historical perspective is followed by a discussion of a very actual issue the trends of stepwise bond dissociation enthalpies Geoff Pilcher another Manchester thermochemist makes in chapter 2 a comprehensive and authoritative survey of problems found in the most classical of thermochemical techniques combustion calorimetry applied to organometallic compounds Finally results from another classical technique reaction solution calorimetry are reviewed in the third chapter by Tobin Marks and coworkers More than anybody else Tobin Marks has used thermochemical values to define synthetic strategies for organometallic compounds thus indicating an application of thermochemical data of which too little use has been made so far
