**Permutation Design** Kostas Terzidis, 2014-09-04 In design the problems that designers are called upon to solve can be regarded as a problem of permutations A permutation is an ordered arrangement of elements in a set In our case the set is design and the elements are design components such as lines shapes forms or spaces Traditionally such arrangements are done by human designers who base their decision making process either on intuition or on random sampling until a valid solution is found However in both cases the solution found may be an acceptable one but cannot be labeled as the best possible solution due to the subjective or arbitrary nature of the selection process In contrast by harnessing the potential of computational design these elements can be arranged in all possible ways and then the best ones are chosen based on specific criteria By presenting a complete list of permutation based arrangements the best solution will eventually reveal itself by excluding all other possible solutions This book comprehensively addresses theories techniques and examples of permutation design in order to fully demonstrate to the reader the full range of possibilities this method represents The significance of such an approach to design is enormous paradigmatic and far reaching It provides an alternative method for design analysis synthesis and evaluation that is based on computational force rather than pure human intelligence alone In contrast to human based random sampling or intuition permutation based design offers the assurance of an optimum design since any possible alternative design can be eliminated From a practical point of view this methodology offers a paradigmatic shift away from the current state of design practice where arbitrariness repetition and redundancy often exist From a theoretical viewpoint this new paradigm will offer alternative insights into the value of human creativity intuition and intelligence

Art-Making as Problem-Solving Melvin Chen, 2025-09-19 What is art making What is it in virtue of which an artifact counts as a work of art In this book Melvin Chen contends that art making is best understood in the context of problem solving Works of art are various ways in which artists solve problems and overcome obstacles while typically exhibiting creative thinking Using the theory of problem solving its theoretical milieu and various philosophical tools Chen builds a robust coherent and consistent computationalist approach to art making and the production of works of art This computationalist approach to art making and the production of works of art in turn is articulated against the backdrop of an information theoretic philosophy of art This computationalist approach takes discussions in the philosophy of art into the twenty first century **Discrete** Gilles Retsin, 2019-04-29 After two decades of experimentation with the digital the prevalent paradigm of formal continuity is being revised and questioned by an emerging generation of architects and theorists While the world struggles with a global housing crisis and the impact of accelerated automation on labour digital designers narrow focus on mere style and continuous differentiation seems increasingly out of touch This issue charts an emerging body of work that is based on a computational understanding of the discrete part or building block elements that are as scalable accessible and versatile as digital data The discrete proposes that a new digital understanding of assembly based on parts contains the greatest promise for a complex open ended adaptable architecture This approach capitalises on the digital economy and automation with the potential of the digital to democratise production and increase access The digital not only has deep implications for how we design and produce architecture it is first and foremost a new system of production with economic social and political consequences that need to be taken into account This issue presents a diverse body of work focused on the notion of the discrete from design experiments and aesthetics to urban models tectonics

**Prozess als Gestalt** Fabian Kragenings, 2022-02-03 Die Bedingungen der digitalen Gegenwart lassen ein Entwerfen in starren Schemata und isolierten Einzelbetrachtungen längst nicht mehr zu. Die sich permanent verändernden Kontexte fordern eine grundlegende Anpassungsfähigkeit des Designs, die nur durch eine ganzheitliche Betrachtung der Dinge in ihren Zusammenhängen und ein gestalterisches Denken in Veränderungen sichergestellt werden kann. Durch Parametrie Fabian Kragenings deutet einen Paradigmenwechsel an, durch welchen Designer:innen nicht mehr den konkreten Entwurf sondern die Bedingungen des Entwerfens selbst gestalten. Nicht mehr abgeschlossene Produkte sondern anschlussfähige Prozesse sind es, die nunmehr eine Gestalt erhalten.

Handbook of combinatorial optimization Dingzhu Du, Panos M. Pardalos, 1998-12-15 Combinatorial or discrete optimization is one of the most active fields in the interface of operations research, computer science and applied mathematics. Combinatorial optimization problems arise in various applications including communications network design, VLSI design, machine vision, air line crew scheduling, corporate planning, computer aided design and manufacturing, database query design, cellular telephone frequency assignment, constraint directed reasoning and computational biology. Furthermore, combinatorial optimization problems occur in many diverse areas such as linear and integer programming, graph theory, artificial intelligence and number theory. All these problems when formulated mathematically as the minimization or maximization of a certain function defined on some domain have a commonality of discreteness. Historically, combinatorial optimization starts with linear programming. Linear programming has an entire range of important applications including production planning and distribution, personnel assignment, finance allocation of economic resources, circuit simulation and control systems. Leonid Kantorovich and Tjalling Koopmans received the Nobel Prize 1975 for their work on the optimal allocation of resources. Two important discoveries: the ellipsoid method 1979 and interior point approaches 1984 both provide polynomial time algorithms for linear programming. These algorithms have had a profound effect in combinatorial optimization. Many polynomial time solvable combinatorial optimization problems are special cases of linear programming, e.g. matching and maximum flow. In addition, linear programming relaxations are often the basis for many approximation algorithms for solving NP hard problems, e.g. dual heuristics.
