Engineering the Environment David P. D. Munns, 2017-07-19 Promising an end to global hunger and political instability huge climate controlled laboratories known as phytotrons spread around the world to thirty countries after the Second World War The United States built nearly a dozen including the first at Caltech in 1949 Made possible by computers and other novel greenhouse technologies of the early Cold War phytotrons enabled plant scientists to experiment on the environmental causes of growth and development of living organisms Subsequently they turned biologists into technologists who in their pursuit of knowledge about plants also set out to master the machines that controlled their environment Engineering the Environment tells the forgotten story of a research program that revealed the shape of the environment the limits of growth and development and the limits of human control over complex technological systems As support and funding for basic science dwindled in the mid 1960s phytotrons declined and ultimately disappeared until nearly thirty years later the British built the Ecotron to study the impact of climate change

Microbiology of the Rapidly Changing Polar Environments Julie Dinasquet,Eva Ortega-Retuerta,Connie Lovejoy,Ingrid Obernosterer,2018-07-05 Marine and freshwater polar environments are characterized by intense physical forces and strong seasonal variations The persistent cold and sometimes inhospitable conditions create unique ecosystems and habitats for microbial life Polar microbial communities are diverse productive assemblages which drive biogeochemical cycles and support higher food webs across the Arctic and over much of the Antarctic Recent studies on the biogeography of microbial species have revealed phylogenetically diverse polar ecotypes suggesting adaptation to seasonal darkness sea ice coverage and high summer irradiance Because of the diversity of habitats related to atmospheric and oceanic circulation and the formation and melting of ice high latitude oceans and lakes are ideal environments to investigate composition and functionality of microbial communities In addition polar regions are responding more dramatically to climate change compared to temperate environments and there is an urgent need to identify sensitive indicators of ecosystem history that may be sentinels for change or adaptation For instance Antarctic lakes provide useful model systems to study microbial evolution and climate history Hence it becomes essential and timely to better understand factors controlling the microbes and how in turn they may affect the functioning of these fragile ecosystems Polar microbiology is an expanding field of research with exciting possibilities to provide new insights into microbial ecology and evolution With this Research Topic we seek to bring together polar microbiologists studying different aquatic systems and components of the microbial food web to stimulate discussion and reflect on these sensitive environments in a changing world perspective
