Autonomous Control of Unmanned Aerial Vehicles

Victor Becerra,2019-06-24 Unmanned aerial vehicles UAVs are being increasingly used in different applications in both military and civilian domains These applications include surveillance reconnaissance remote sensing target acquisition border patrol infrastructure monitoring aerial imaging industrial inspection and emergency medical aid Vehicles that can be considered autonomous must be able to make decisions and react to events without direct intervention by humans Although some UAVs are able to perform increasingly complex autonomous manoeuvres most UAVs are not fully autonomous instead they are mostly operated remotely by humans To make UAVs fully autonomous many technological and algorithmic developments are still required For instance UAVs will need to improve their sensing of obstacles and subsequent avoidance This becomes particularly important as autonomous UAVs start to operate in civilian airspaces that are occupied by other aircraft The aim of this volume is to bring together the work of leading researchers and practitioners in the field of unmanned aerial vehicles with a common interest in their autonomy The contributions that are part of this volume present key challenges associated with the autonomous control of unmanned aerial vehicles and propose solution methodologies to address such challenges analyse the proposed methodologies and evaluate their performance

Monitoring endogenous GPCRs: lessons for drug design Dominique Massotte, 2015-10-07 G protein coupled receptors GPCRs are integral membrane proteins forming the fourth largest superfamily in the human genome Many of these receptors play key physiological roles and several pathologies have been associated with receptor functional abnormalities

GPCRs therefore represent important goals for drug design in pharmaceutical companies since they constitute the target of about one third of the drugs currently on the market. However, endogenous GPCRs are most often difficult to study because of a lack of tools to target them specifically and single out their response to physiological or drug elicited stimulations. Hence, studies mostly focused on recombinant receptors expressed in a variety of cellular models that do not always closely reflect the receptor natural environment and often deal with levels of expression exceeding by far physiological ranges. Recent technological developments combining for example genetically modified animals and advanced imaging approaches have improved our ability to visualize endogenous GPCRs. To date, trailing receptor activation subsequent intracellular redistribution changes in signaling cascade up to integrated response to a drug elicited stimulation is at hand, though the impact of a physiological challenge on receptor dynamics remains a major issue. Data however suggest that the receptor may embrace a different fate depending on the type of stimulation in particular if sustained or repeated. This suggests that current drugs may only partially mimic the genuine response of the receptor and may explain at least in part their secondary effects. Commonalities and specificities between physiological and drug induced activation can thus represent valuable guidelines for the design of future drugs.

therapeutic implications Megan Chircop, Daniel Speidel, 2015-03-06. In response to stress, cells can activate a myriad of signalling pathways to bring about a specific cellular outcome including cell cycle arrest, DNA repair, senescence, and apoptosis. This response is pivotal for tumour suppression as all of these outcomes result in restriction of the growth and or

elimination of damaged and pre malignant cells Thus a large number of anti cancer agents target specific components of stress response signalling pathways with the aim of causing tumour regression by stimulating cell death However the efficacy of these agents is often impaired due to mutations in genes that are involved in these stress responsive signalling pathways and instead the oncogenic potential of a cell is increased leading to the initiation and or progression of tumourigenesis Moreover these genetic defects can increase or contribute to resistance to chemotherapeutic agents and or radiotherapy Modulating the outcome of cellular stress responses towards cell death in tumour cells without affecting surrounding normal cells is thus one of the ultimate aims in the development of new cancer therapeutics To achieve this aim a detailed understanding of cellular stress response pathways and their aberrations in cancer is required This Research topic aims to reflect the broadness and complexity of this important area of cancer research *Proceedings of the Second International Conference on Soft Computing for Problem Solving (SocProS 2012), December 28-30, 2012* B. V. Babu, Atulya Nagar, Kusum Deep, Millie Pant, Jagdish Chand Bansal, Kanad Ray, Umesh Gupta, 2014-07-08 The present book is based on the research papers presented in the International Conference on Soft Computing for Problem Solving SocProS 2012 held at JK Lakshmipat University Jaipur India This book provides the latest developments in the area of soft computing and covers a variety of topics including mathematical modeling image processing optimization swarm intelligence evolutionary algorithms fuzzy logic neural networks forecasting data mining etc The objective of the book is to familiarize the reader with the latest scientific developments that are taking place in various fields and the latest sophisticated problem solving tools that are being developed to deal with the complex and intricate problems that are otherwise difficult to solve by the usual and traditional methods The book is directed to the researchers and scientists engaged in various fields of Science and Technology
