NOTES:

- ¹⁾  Consult gear, bearing and lubricant suppliers if a viscosity grade of less than 68 or greater than 680 is indicated.
-  Review anticipated cold start, peak and operating temperatures, service duty and range of loads when considering these viscosity grades.
-  Select the viscosity grade that is most appropriate for the anticipated stabilized bulk oil operating temperature range.
-  Baseline stabilized bulk oil operating temperature and bearing lubrication requirements.
- ²⁾ This table assumes that the lubricant retains its viscosity characteristics over the expected oil change interval. Consult the lubricant supplier if this does not apply.
- ³⁾ Determine pitch line velocity of all gearsets. Select viscosity grade for critical gearset taking into account cold startup conditions.
- ⁴⁾ For pitch line velocities greater than 30 m/s see ANSI/AGMA 6011 [18].

Lubricants with a VI of 160, such as typically found in PAO based gear lubricants, are generally suitable for use in a wider range of ambient and operating sump temperatures. Extreme variations in start-up, operating sump temperatures, or both may require a higher VI unless oil sump temperatures are controlled by other means.
