**This study guide is meant as a GUIDE. It is not a substitute to studying the notes or learning the vocabulary or completing the review sheet. **

- Energy flows from the sun and through all life on earth.
- Autotrophs use the sun to make food directly while heterotrophs must consume other organisms for food.
- ATP (energy) stands for Adenosine Triphosphate.
- Photosynthesis is the process where plants use the sun's energy to make food.
Photosynthesis: Stores energy from sunlight in glucose molecules
- Know the equation: $6 \text{ CO}_2 + 6 \text{ H}_2\text{O} + (\text{light}) \text{ energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6 \text{ O}_2$
 - Carbon Dioxide + Water + Sunlight (energy) \rightarrow Glucose + Oxygen
- Photosynthesis takes place in chloroplasts where plant pigments absorb light.
- Explain photosynthesis as a biochemical pathway.
- Understand light, temperature and CO_2 all affect the rate of photosynthesis
- Review the visible light spectrum - i.e. different wavelengths produce different colors: colors are a reflection of that wavelength.
 - Chlorophyll is the main pigment involved in photosynthesis, absorbing red and blue light and reflecting green (why plants look green).
 - Accessory pigments (i.e. carotenoid) are also involved in helping to capture light.
 - During autumn, as the chlorophyll breaks down, the other pigments become visible, changing the colors of the leaves.
- Identify the difference between autotrophs and heterotrophs

Review the structure of the chloroplast. Pay special attention to the labeled parts.

Baker, H.C. Thomas, 2013-10-22

Since photosynthetic performance is a fundamental determinant of yield in the vast majority of crops an understanding of the factors limiting photosynthetic productivity has a crucial role to play in crop improvement programmes

Photosynthesis unlike the majority of physiological processes in plants has been the subject of extensive studies at the molecular level for many years This reductionist approach has resulted in the development of an impressive and detailed understanding of the mechanisms of light capture energy transduction and carbohydrate biosynthesis processes that are clearly central to the success of the plant and the productivity of crops This volume examines in the widest context the factors determining the photosynthetic performance of crops The emphasis throughout the book is on the setting for photosynthesis rather than the fundamental process itself The book will prove useful to a wide range of plant scientists and will encourage a more rapid integration of disciplines in the quest to understand and improve the productivity of crops by the procedures of classical breeding and genetic manipulation
