Constrained Optimal Control of Linear and Hybrid Systems Francesco Borrelli,2003-09-04 Many practical control problems are dominated by characteristics such as state input and operational constraints alternations between different operating regimes and the interaction of continuous time and discrete event systems At present no methodology is available to design controllers in a systematic manner for such systems This book introduces a new design theory for controllers for such constrained and switching dynamical systems and leads to algorithms that systematically solve control synthesis problems The first part is a self contained introduction to multiparametric programming which is the main technique used to study and compute state feedback optimal control laws The book s main objective is to derive properties of the state feedback solution as well as to

obtain algorithms to compute it efficiently The focus is on constrained linear systems and constrained linear hybrid systems The applicability of the theory is demonstrated through two experimental case studies a mechanical laboratory process and a traction control system developed jointly with the Ford Motor Company in Michigan International Aerospace Abstracts,1998

Identification for Automotive Systems Daniel Alberer,Håkan Hjalmarsson,Luigi del Re,2011-12-04 Increasing complexity and performance and reliability expectations make modeling of automotive system both more difficult and more urgent Automotive control has slowly evolved from an add on to classical engine and vehicle design to a key technology to enforce consumption pollution and safety limits Modeling however is still mainly based on classical methods even though much progress has been done in the identification community to speed it up and improve it This book the product of a workshop of representatives of different communities offers an insight on how to close the gap and exploit this progress for the next generations of vehicles Applied Mechanics Reviews ,1979

Atluri,A.K. Amos,2012-12-06 This monograph is intended to provide a snapshot of the status and opportunities for advancement in the technologies of dynamics and control of large flexible spacecraft structures It is a reflection of the serious dialog and assessments going on all over the world across a wide variety of scientific and technical disciplines as we contemplate the next major milestone in mankind's romance with space the transition from exploration and experimentation to commercial and defense exploitation This exploitation is already in full swing in the space communications area Both military and civilian objectives are being pursued with increasingly more sophisticated systems such as large antenna reflectors with active shape control Both the NATO and Warsaw pact alliances are pursuing permanent space stations in orbit large structural systems whose development calls for in situ fabrication and or assembly and whose operation will demand innovations in controls technology The last ten years have witnessed a fairly brisk research activity in the dynamics and control of large space structures in order to establish a technology base for the development of advanced spacecraft systems envisioned for the future They have spanned a wide spectrum of activity from

fundamental methods development to systems concept studies and laboratory experimentation and demonstrations Some flight experiments have also been conducted for various purposes such as the characterization of the space environment durability of materials and devices in that environment assembly and repair operations and the dynamic behavior of flexible structures It is this last area that has prompted this monogram **European Control Conference 1995** ,1995-09-05
