Regulating the Cell Cycle

Control mechanisms for this process are located below. All in all, cells that with multiple errors have a high frequency of developing into cancer cells.

Lesson Summary

Controls on Cell Division

Cells regulate growth and development.

The cell cycle is a complex process that is tightly controlled. It is regulated by a variety of factors, including internal and external signals.

Cells that divide more often are more likely to develop into cancer cells. This is because the more often a cell divides, the more likely it is to make a mistake. Mistakes in the cell cycle can lead to the development of cancer. Cells that divide less often are less likely to develop into cancer cells. This is because the fewer times a cell divides, the less likely it is to make a mistake. Cells that divide in response to external signals are more likely to develop into cancer cells. This is because external signals can sometimes be misinterpreted by the cell, leading to uncontrolled growth.

It is the process of cell division that allows for growth, development, and repair. It is a tightly controlled process that is regulated by a variety of factors, including internal and external signals.
