Numerical Development - From cognitive

functions to neural underpinnings Korbinian Moeller, Elise Klein, Klaus F Willmes - von Hinckeldey, Karin Kucian, 2015-02-24

Living at the beginning of the 21st century requires being numerate because numerical abilities are not only essential for life prospects of individuals but also for economic interests of post industrial knowledge societies. Thus numerical development is at the core of both individual as well as societal interests. There is the notion that we are already born with a very basic ability to deal with small numerosities. Yet this often called number sense seems to be very restricted, approximate and driven by perceptual constraints. During our numerical development in formal e.g. school but also informal contexts e.g. family street we acquire culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic digits refining our numerical capabilities. In recent years numerical development has gained increasing research interest documented in a growing number of behavioural neuro scientific educational cross cultural and neuropsychological studies addressing this issue. Additionally our understanding of how numerical competencies develop has also benefitted considerably from the advent of different neuro imaging techniques allowing for an evaluation of developmental changes in the human brain. In sum we are now starting to put together a more and more coherent picture of how numerical competencies develop and how this development is associated with neural changes as well. In the end this knowledge might also lead to a better understanding of the reasons for atypical numerical development which often has grievous consequences for those who suffer from developmental dyscalculia or mathematics learning disabilities. Therefore this Research Topic deals with all aspects of numerical development findings from behavioural performance to underlying neural substrates from cross sectional to longitudinal evaluations from healthy to clinical populations. To this end we included empirical contributions using different experimental methodologies but also theoretical contributions review articles or opinion papers.

The School Board Effect Alexander U. Ikejiaku, 2013-08-12 Every school board adopts a unique governing style which affects the way the district is managed. This book identifies some of those styles and examines their potential impact on district administration and ultimately on student achievement. The book also clarifies the role of school boards in unequivocal terms, discusses board superintendent relations and offers several recommendations and critical takeaways for education stakeholders. The authors' doctoral research which gave rise to this book shows that a school board's governing style has the potential to affect educational outcomes in consequential ways particularly in urban districts where the greatest impact was observed. A content outline for a set of professional development modules on school board governance is provided in the book including an in depth review of the roles and responsibilities of school boards and some case studies on board superintendent interaction.

Sickle Cell Disease Ike Oluwa Lagunju, Manoelle Kossorotoff, Fenella Jane Kirkham, Andria Ford, 2024-03-05 Sickle cell disease (SCD) is the most common cause of ischemic and hemorrhagic stroke in children and without treatment has a very high rate of recurrence. Acute neurological symptoms and signs are common in SCD at any age and as well as stroke include transient ischaemic attack, headaches, seizures and coma. An altered mental status with or without reduced level of

consciousness headache seizures visual loss or focal signs can occur spontaneously but also in numerous contexts such as infection acute chest syndrome ACS and acute anaemia Nearly 50 years ago it was clear from conventional cerebral angiography studies that the large extracranial and intracranial vessels were abnormal in patients with SCD and neurologic deficits although the pathophysiology is not fully understood from human studies or laboratory models Transcranial Doppler ultrasound has been used successfully to predict stroke risk in children although those with abnormal time averaged maximum mean velocity 200 cm sec may have very high blood flow or arterial stenosis Although there are relatively few studies with matched controls silent cerebral infarction on MRI is found in a high proportion of patients with SCD without clinical symptoms sometimes starting as early as the 6th month of life steadily accumulating with age and predicting overt stroke Meta analyses have shown that typically siblings children and adults with SCD have cognitive difficulties over a wide range of domains compared with matched controls This includes processing speed and executive function
