sediment on the order of grams per litre and the invertebrates generally survived similar exposures to tens of grams per litre of relatively uncontaminated sediment Exposure to suspensions of contaminated sediment decreased survival substantially but even so mortality occurred only after exposure to higher concentrations for longer time periods than are created in the water column by the typical dredging operation Only fingerling striped bass *Morone saxatilis* showed a sensitivity great enough to indicate a potential cause for concern from continuous pipeline discharge of highly contaminated dredged material Tissue uptake of contaminants from suspensions of highly contaminated sediment was limited Of 100 species salinity contaminant combinations where uptake might have been measured it actually occurred in less than one fourth of the cases
