Deep Learning in Textual Low-Data Regimes for Cybersecurity Markus Bayer, 2025-08-20 In today s fast paced cybersecurity landscape professionals are increasingly challenged by the vast volumes of cyber threat data making it difficult to identify and mitigate threats effectively Traditional clustering methods help in broadly categorizing threats but fall short when it comes to the fine grained analysis necessary for precise threat management Supervised machine learning offers a potential solution but the rapidly changing nature of cyber threats renders static models ineffective and the creation of new models too labor intensive This book addresses these challenges by introducing innovative low data regime methods that enhance the machine learning process with minimal labeled data The proposed approach spans four key stages Data Acquisition Leveraging active learning with advanced models like GPT 4 to optimize data labeling Preprocessing Utilizing GPT 2 and GPT 3 for data augmentation to enrich and diversify datasets Model Selection Developing a specialized cybersecurity language model and using multi level transfer learning Prediction Introducing a novel adversarial example generation method grounded in explainable AI to improve model accuracy and resilience

Ethics and Governance of Public Health Information Stephen Holland, 2019-10-04 The ethics and governance of health information is a major contemporary problem The central dilemma is between the social utility gained by exploiting health data for public health purposes and privacy concerns about collecting and using personal information There is a discernible tendency in our digital age to prioritise privacy protection over social utility which results in increasingly restrictive regulation of data including health data This book defends public health from this distinctive threat The book starts with a comprehensive taxonomy of public health information including a novel take on

the notoriously vexed research practice distinction and a discussion of the best governance arrangements for all public health information Privacy is clearly central to this so the concept of privacy is analysed to clarify the sort of privacy concerns relevant to public health information This reveals that risks and harms associated with identifiable data are overstated for example when all public health data are assumed to be equally dangerous Conversely resources to manage privacy concerns about public health information are systematically understated For one thing public health should continue its traditional reliance on anonymization to protect individual privacy despite increasingly sophisticated re identification techniques Also the requirement to gain consent from individuals to use their information is offset by a duty to provide personal data for the sake of public health In the same vein the book ends with a discussion of trust arguing that there are underemployed ways of increasing public trust in the institutions responsible for managing public health data
