### Abstract

Radium (Ra), Fermium (Fm), and Americium (Am) are elements belong to the actinide series (Actinides are a group of elements with atomic numbers ranging from 90 to 103, all of which are radioactive and have similar chemical properties) and were discovered or synthesized in the 20th century. They have varying levels of radioactivity and toxicity, and their properties make them useful in different applications.

### INTRODUCTION

Radium (Ra), Fermium (Fm), and Americium (Am) are three elements with unique properties and uses. Radium is a highly radioactive metal that was discovered in 1898 by Marie and Pierre

Curie. It is used in some medical treatments, such as radiation therapy for cancer, but is highly toxic and can cause health problems if not handled properly.

Fermium is a synthetic element that was first synthesized in 1952 by a team of scientists led by Glenn T. Seaborg. It is highly radioactive and has no known uses outside of scientific research.

Americium is also a synthetic element that was first produced in 1944 by a team of scientists led by Glenn T.

### ANALYSIS

Radium (Ra) is a highly radioactive element that belongs to the alkaline earth metals group. It was discovered by Marie and Pierre Curie in 1898 and named after the Latin word "radius," which means ray, due to its high radioactivity. Radium is silvery-white in color and has a melting point of 700°C. It is a rare element found in uranium ores and other minerals. Radium is known for its high radioactivity and emits alpha, beta, and gamma rays. It has a half-life of 1600 years, which means it takes that amount of time for half of the radium atoms to decay. This property

makes it useful in various applications such as cancer treatment, where it is used to destroy cancer cells. However, radium is also highly reactive and can react with water, oxygen, and other elements to form compounds. This property makes it dangerous to handle, as it can cause burns and other health problems if ingested or inhaled.
