

Alcohol Abuse and Alcoholism: Research

The National Institute of Alcohol Abuse and Alcoholism defines binge drinking as “5 or more alcoholic drinks for males or 4 or more alcoholic drinks for females on the same occasion at least one day in the past month”.¹ This serious public health problem is largely preventable as it is one of the most expensive patterns of excessive alcohol use in the United States.^{2,3} Furthermore, binge drinking can lead to serious health problems such as liver disease, cancer, alcohol dependence, and exacerbate mental health conditions such as depression and anxiety.⁴ A study showed that women who consumed 77 drinks reported more mentally unhealthy days than those women who only had 4 drinks.⁵ Another study showed that binge drinking increases the reporting of suboptimal self-rated health status.⁶ Additionally, low socioeconomic status is associated with binge drinking; disadvantaged populations often participate in greater alcohol-related harms including binge drinking which increases their overall rates of chronic disease.⁷

An interesting gap in knowledge around binge drinking is the prevalence of binge drinking in people taking psychiatric medications. Most medications, especially psychiatric medications, instruct users to not combine them with alcohol because it impairs thinking and alertness and can increase feelings of depression or anxiety. Specifically, monoamine oxidase inhibitors (MAOIs) can cause a spike in blood pressure which can be dangerous if the medication and alcohol are combined.⁸ This dangerous combination of psychiatric medications and binge drinking can gravely impact mental health recovery but also increase the chance of developing alcohol misuse disorder.⁴ Further, previous research has explored binge drinking and risk factors but this would be an update with a longer range of time done in a different data set. The National Health and Nutrition Examination Survey collects more information via examination and laboratory tests through in-person delivery versus the Behavioral Risk Factor Surveillance Survey which is a health-related telephone survey. A limitation of these studies is that surveys are often self-reported which means underreporting and response bias can affect the overall results and response rates are mixed for large national health surveys.

With the gaps and limitations around this topic, what is the prevalence of psychiatric medication use among binge drinkers in the United States? Anyone that takes psychiatric medications or medications in general are told of the possible consequences when mixing alcohol and prescription medications. It is critical to understand the demographic of people who participate in binge drinking while taking psychiatric medications because it changes how an intervention can be implemented. Additionally, the bodily stress from binge drinking such as changes in alcohol absorption and the metabolism of alcohol can change medication efficacy.⁹ Most of the national evaluations on b
