

Optics - The Study of Light

Refraction

Light refracts when passing between two substances at an angle.

Light does not bend as glass that is not at an angle from the surface of the water.

Light bends as it goes from air into water, bending towards the normal as it enters the water.

The refractive index (n) is a measure of how much light bends when it enters a medium.

Reflection

Light reflects off a surface at the same angle.

Normal - an imaginary line 90° perpendicular to a surface.

Angle of Incidence - the angle between the incident ray and the normal.

Angle of Reflection - the angle between the reflected ray and the normal.

Focus

Focus - the point where parallel light rays converge after reflection from a curved surface. This is known as the focal point or focus.

Concave Mirrors

Concave mirrors focus light rays that are parallel to the principal axis to a single point called the focal point.

Convex Mirrors

Convex mirrors diverge light rays, making them appear to come from a focal point behind the mirror.

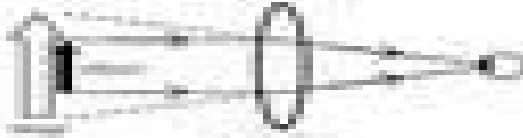

The image is virtual, upright, and smaller than the object.

Lenses

Converging and diverging lenses focus light rays. A converging lens focuses light to a point, while a diverging lens spreads light out.

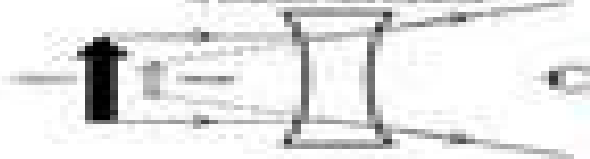

Converging lenses focus light rays to a point, while diverging lenses spread light out.

A converging lens focuses light rays to a point.

A converging lens is thicker in the middle than at the edges.

A diverging lens spreads light rays out.

A diverging lens is thinner in the middle than at the edges.

Image is virtual and upright.

Concave Mirrors

Optical Systems

Optical systems use multiple lenses to focus light. They can be used to create images, project light, or focus light on a sensor.

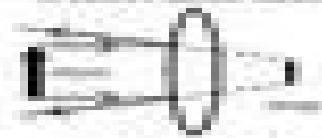

Optical systems are used in many applications, including cameras, telescopes, and microscopes.

Images

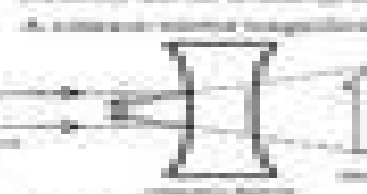

Images are formed by light rays. A real image is formed when light rays converge at a point, while a virtual image is formed when light rays appear to diverge from a point.

For a real image, the light rays actually meet at a point. For a virtual image, the light rays only appear to meet at a point.

A real image is inverted and can be projected onto a screen.

A virtual image is upright and cannot be projected onto a screen.

A virtual image is upright and larger than the object. It is formed by a diverging lens or a converging lens when the object is closer to the lens than the focal point.
