Nuclear Science Abstracts ,1975 **Eye movement-related brain activity during perceptual and cognitive processing** Andrey R. Nikolaev, Sebastian Pannasch, Junji Ito, Artem Belopolsky, 2014-09-23 The

recording and analysis of electrical brain activity associated with eye movements has a history of several decades. While the early attempts were primarily focused on uncovering the brain mechanisms of eye movements, more recent approaches use eye movements as markers of the ongoing brain activity to investigate perceptual and cognitive processes. This recent approach of segmenting brain activity based on eye movement behavior has several important advantages. First, the eye movement system is closely related to cognitive functions such as perception, attention, and memory. This is not surprising since eye movements provide the easiest and the most accurate way to extract information from our visual environment, and the eye movement system largely determines what information is selected for further processing. The eye movement based segmentation offers a great way to study brain activity in relation to these processes. Second, on the methodological level, eye movements constitute a natural marker to segment the ongoing brain activity. This overcomes the problem of introducing artificial markers such as ones for stimulus presentation or response execution that are typical for a lab based research. This opens possibilities to study brain activity during self-paced perceptual and cognitive behavior under naturalistic conditions such as free exploration of scenes. Third, by relating eye movement behavior to the ongoing brain activity, it is possible to see how perceptual and cognitive processes unfold in time, being able to predict how brain activity eventually leads to behavior. This research topic illustrates advantages of the combined recording and analysis of eye movements and neural signals such as EEG, local field potentials, and fMRI for investigation of the brain processes in humans and animals. The contributions include research papers, methodology papers, and reviews demonstrating conceptual and methodological achievements in this rapidly developing field.

Refereed and selected contributions from International Conference on Quark Nuclear Physics
Charlotte Elster, Josef Speth, Thomas Walcher, 2013-06-29

The International Conference on Quark Nuclear Physics 2002 QNP2002 was held in the Forschungszentrum Jilich from June 9 to 14, 2002. It was organized by the Institute of Nuclear Physics IKP at the Forschungszentrum Jilich together with the Universities of Bonn and Mainz. This meeting takes place every two years and was the successor to QNP2000 which was held in Adelaide. QNP2002 brought together about 200 scientists from 25 countries who met for their scientific work in the Forschungszentrum but spent their free time in the medieval city of Aachen, the former capital of Charles the Great. The particular feature of this conference is that it provides a comprehensive overview of the attempts in understanding hadrons and nuclei, including dense matter, in terms of their fundamental constituents, the quarks and the gluons. One of the basic themes of the program was that fact that we do have an underlying theory of strongly interacting particles, namely the QCD. For that reason, the experimental topics covered during the meeting ranged from precision measurements with hadronic and electromagnetic probes to ultra-relativistic heavy ion reactions. Correspondingly, the theoretical topics spanned an equally wide range, including perturbative and lattice QCD calculations as well as effective theories and QCD motivated quark models. In the morning sessions, invited reviews were given. In the afternoon, twelve topical parallel sessions, directed by conveners, summarized the newest research results.

Understanding the Molecular Mechanisms of Plant Responses to Abiotic Stress Sang Yeol Lee,Dae-Jin Yun,Jose M.

Pardo,Motoaki Seki,Yan Guo,Abel Rosado,2020-02-20 Plant responses to environmental stress are governed by complex molecular and biochemical signal transduction processes which act in coordination to determine tolerance or sensitivity at the whole plant level Upon exposure to abiotic stress plants express a sophisticated coordinated response to reprogram interconnected defense networks and metabolic pathways by alterations in the transcription translation and post translational modification of defense related genes and proteins Traditionally physiological and phenotypic responses were the major ones to be collected in plant stress biology However modern studies include the identification of key genes that influence stress tolerance and plant growth under the imposing stress and the verification of gene functions using knock out mutants or overexpression lines In addition genomics has become a necessary tool for the understanding of plant stress responses at the whole genome levels The identification of stress tolerant plant resources and the investigation of the functional role of the genetic variants is also a valuable tool in this research field Recently the advent of CRISPR Cas genome editing technology enables these variations to be introduced in crops for improved stress tolerance traits Through the understanding of the molecular mechanisms involved in plant signaling in response to abiotic stress and crop performance characters under stress conditions we hope to open new ways for the breeding of superior crops
