 4. 1/3 of all compounds in the body are proteins.
 5. Proteins are found in all living cells.
 6. Proteins are made up of amino acids.

Answers to Protein Synthesis Guided Reading

Deoxyribonucleic acid
Double stranded
Thymine, adenine, guanine, cytosine

Protein synthesis is the process by which a cell builds a protein. It is the process by which the information encoded in a gene is used to synthesize a protein. The process involves two main steps: transcription and translation. Transcription is the process by which the information in a gene is copied into a messenger RNA (mRNA) molecule. Translation is the process by which the information in the mRNA molecule is used to synthesize a protein.

During transcription, the DNA double helix is unwound, and one strand is used as a template to synthesize a complementary mRNA strand. The mRNA strand then moves to the ribosome, where translation occurs. The ribosome reads the mRNA sequence and uses it to assemble a protein chain from amino acids.
