

Chapter 5: Sensation and Perception

PSY 200

- Section 5.1: How Do Sensation and Perception Affect Us?

- **Sensation:** The sense organs' detection of external physical stimulus and the transmission of information about this stimulus to the brain.
- **Perception:** The processing, organization, and interpretation of sensory signals in the brain; these processes result in an internal neural representation of the physical stimulus.
- **Sensory Receptors:** Sensory organs that detect physical stimulation from the external world and change that stimulation into information that can be processed by the brain.
- **Difference Threshold:** The minimum difference in physical stimulation required to detect a difference between sensory inputs.
- **Signal Detection Theory:** Detection of a faint stimulus requires a judgment—it is not an all-or-none process.
- **Sensory Adaptation:** A decrease in sensitivity to a constant level of stimulation.

5.1 CHECKPOINT: How Do Sensation and Perception Affect Us?

LEARN

- Sensation is the detection of light, sound, touch, taste, and smell. Perception is how the brain interprets this information.
- Sensory receptors transduce sensory input into signals. Except for smell, this information is sent to the thalamus and relevant parts of the cortex for further processing.
- Absolute threshold and difference threshold describe how much physical stimulus must be present for detection to happen.
- Signal detection theory explains how our judgments affect our ability to detect input.
- Our senses adapt to constant stimulation and detect changes in our environment.

- Section 5.2: How Do We See?

- **Lens:** The adjustable, transparent structure behind the pupil; this structure focuses light on the retina, resulting in a crisp visual image.
