

Fluids and Pressure

BEFORE YOU READ

After you read this section, you should be able to answer these questions:

- What are fluids?
- What is atmospheric pressure?
- What is water pressure?
- What causes fluids to flow?

What Are Fluids?

You have something in common with a dog, a sea gull, and a dolphin. You and all these other animals spend a lifetime moving through fluids. A **fluid** is any material that can flow and that takes the shape of its container. Fluids have these properties because their particles can easily move past each other. Liquids and gases are fluids. 

Fluids produce pressure. **Pressure** is the force exerted on a given area. The motions of the particles in a fluid are what produce pressure. For example, when you pump up a bicycle tire, you push air into the tire. Air is made up of tiny particles that are always moving. When air particles bump into the inside surface of the tire, the particles produce a force on the tire. The force exerted on the area of the tire creates air pressure inside the tire.

The air particles inside the tire hit the walls of the tire with a force. This force produces a pressure inside the tire. The pressure keeps the tire inflated.

PRESSURE AND BUBBLES

Why are bubbles round? It's because fluids (such as the gas inside the bubbles) exert the same pressure in all directions. This gives the bubbles their round shape.

STUDY TIP

Explain As you read this section, study each figure. In your notebook, describe what each figure tells you about pressure.

disasters in underground engineering: Theoretical, experimental, and numerical approaches Shengli Yang, Liang Chen, Danqi Li, 2023-12-21 Water inrush WI is one of the most dangerous geological disasters in underground engineering with significant human casualties and economic losses To prevent and control WI disasters great efforts have been made to address WI mechanisms for more than half a century In particular the seepage instability theory is hitherto one of the most widely used theoretical models This theory portrays that the seepage system will undergo structural instability when the initial values of permeability and boundary pressure meet certain conditions which manifests that the permeability parameter is one of the most valuable indicators to unveil WI mechanisms However rock permeability is determined by its internal structural characteristics which can be affected by water chemical composition stress environment and temperature In this regard it is of great necessity and importance to facilitate a better understanding of the holistic impacts of multi field coupling on rock internal structure and deformation failure characteristics This Research Topic aims to initiate a global forum for presenting and disseminating the latest advancements of WI mechanisms which entails the characterization of physical and laboratory tests 3D reconstruction of rock internal structure numerical approaches theoretical models under multi field coupling and field data analysis methods *Reservoir Characterization II* Lake, 2012-12-02 Reservoir
