Section 1 Running Water

Key Concepts

- What is the water cycle?
- What does it mean to say Earth's water cycle is balanced?
- What is the most important factor in determining the power of a stream to erode and transport material?
- How do gradient and discharge change between a stream's source and its mouth?
- What is a stream's base level?

Vocabulary

- water cycle
- infiltration
- gradient
- stream channel
- discharge
- tributary
- meander

Water is everywhere on Earth—oceans, glaciers, rivers, lakes, air, soil, and living tissue. All of these reservoirs make up Earth's hydrosphere. Most of it—about 97.2 percent—is stored in oceans, as Figure 1 shows. Ice sheets and glaciers account for another 2.15 percent, leaving only 0.65 percent to be divided among lakes, streams, groundwater, and the atmosphere. The water found in glaciers, ice sheets, lakes, streams, groundwater, and the atmosphere may seem like a tiny percent of Earth's water, but the actual quantities are great.

Figure 1 Distribution of Earth's Water Using Graphs What percentage of Earth's water is not held in its oceans?

The Water Cycle

Water constantly moves among the oceans, the atmosphere, the solid Earth, and the biosphere. This unending circulation of Earth's water supply is the water cycle. This cycle is possible because water readily changes from one state of matter—solid, liquid, or gas—to another at temperatures and pressure common on Earth's surface. The water cycle, shown in Figure 2, is a gigantic worldwide system powered by energy from the sun. The atmosphere provides the most important link between the oceans and land. Water evaporates into the atmosphere from the ocean, and to a lesser extent from the continents. Winds transport this moisture-rich air until conditions cause the moisture to condense into clouds. Precipitation—rain and snow—then falls to Earth. Precipitation that falls into oceans has completed one full cycle and is ready to begin another. However, water that falls on land must make its way back to the ocean to complete the full cycle.

Accounting for livestock water productivity: How and why? Drastig, K., Vellenga, L., Qualitz, G., Singh, R., Pfister, S., Boulay, A.-M., Wiedemann, S., Prochnow, A., Chapagain, A., De Camillis, C., Opio, C. & Mottet, A., 2021-01-22

The assessment of water productivity in livestock supply chains has a critical role to play in developing productive and sustainable food production systems worldwide In particular the evaluation of water productivity improvement options is key to addressing growing food demand and the projected impacts of climate change under conditions where the availability of land and water resources is increasingly limited In this report we review current applications of water productivity analysis in livestock supply chains To do so we analysed 50 livestock water productivity studies carried out in various regions of the world from 1993 to the present time We reviewed the assessment goals system boundaries methodological approaches water flows modelling tools databases livestock species and the main findings in each of the studies We found that there was no consistency in the methods and approaches used to assess water productivity in livestock production chains The studies varied widely in terms of their assessment goals methodology and the sources of water used for the analysis The main methodological differences were the inclusion or exclusion of background processes such as water input and the treatment of precipitation in accounting for water use in livestock production processes Another key issue was the missing uncertainty assessment which can be classified as input data uncertainty or model uncertainty as well as choice uncertainties The review recommends the further development of guidelines that ensure a consistent and coordinated application of water productivity analysis of livestock production systems world wide
