Wave Properties

Directions: Circle the term that correctly completes each sentence.

1. The wavelength of a transverse wave is often measured from (crest to crest, crest to trough).
2. Waves with greater amplitudes carry (more, less) energy than waves with smaller amplitudes.
3. The amplitude of a wave can be measured from the (medium, crest) or the (trough, wavelength) to the rest position of the wave's medium.
4. The number of waves that pass a point in one (second, minute) is the wave's (amplitude, frequency).
5. Waves with longer wavelengths have a (lower, higher) frequency and waves with shorter wavelengths have a (lower, higher) frequency.
6. A group of molecules that are squeezed together is called a (rarefaction, compression).
7. Electromagnetic waves travel faster in (gases, solids).

Directions: Use the words below to label the diagram. You will use each term more than once. Then answer the questions.

12. What is the wavelength of the wave shown in the diagram?

Wave Propagation in Dissipative Materials B.D. Coleman, M.H. Gurtin, R.I. Herrera, C. Truesdell, 2012-12-06 Common experience reveals two basic aspects of wave propagation First while preserving their identity and travelling at definite speeds sounds finally die out Second weak sounds may combine to form strong noises Theories of acoustic propagation have succeeded in representing these aspects of experience separately but never combined as in nature The classical theories of sound in perfect fluids and elastic solids easily yield common speeds of propagation for plane infinitesimal disturbances but no damping Moreover within EULER'S theory of the perfect fluid or its generalization the GREEN KIRCHHOFF KELVIN theory of finite elasticity weak waves may grow stronger and become shock waves which propagate according to more complicated but equally definite principles Effects of internal damping are easily added for theories of infinitesimal deformation but for finite motions a dead end was reached about sixty years ago Indeed in 1901 DUHEM proved that according to the NAVIER STOKES theory of fluids acceleration waves and waves of higher order cannot exist and for shock waves he claimed a similar result which has since been shown to be valid subject to certain qualifications So as to save the phenomena of sound and noise as was necessary if the NAVIER STOKES theory was to deserve the place proposed for it as a refinement upon EULER'S theory DUHEM introduced the concept of quasi wave a region of rapid but continuous transition
