H.G. Muller, M.V. Fedorov, 1996-05-31 Atoms in strong radiation fields are interesting objects for study and the research field that concerns itself with this study is a comparatively young one. For a long period after the discovery of the photoelectric effect it was not possible to generate electromagnetic fields that did more than perturb the atom only slightly and first order perturbation theory could perfectly explain what was going on at those low intensities. The development of the pulsed laser has changed this state of affairs in a rather dramatic way and fields can be applied that really have a large or even dominant influence on atomic structure. In the latter case we speak of superintense fields. Since the interaction between atoms and electromagnetic waves is characterized by many parameters other than the light intensity such as frequency, ionization potential, orbit time etc it is actually quite difficult to define what is exactly meant by the term superintense. Obviously the term does not have an absolute meaning and intensity should always be viewed in relation to other properties of the system. An atom in a radiation field can thus best be described in terms of various ratios of the quantities involved. The nature of the system sometimes drastically changes if the value of one of these parameters exceeds a certain critical value and the new regime could be called superintense with respect to that parameter.

Chemistry James N. Spencer, George M. Bodner, Lyman H. Rickard, 2010-12-28 Chemistry Structure and Dynamics 5th Edition emphasises deep understanding rather than comprehensive coverage along with a focus on the development of inquiry and reasoning skills. While most mainstream General Chemistry texts offer a breadth of content coverage the Spencer author team in contrast focuses on depth and student preparation for future studies. The fifth edition is revised in keeping with our commitment to the chemical education community and specifically the POGIL Process Oriented Guided Inquiry Learning Project. This text reflects two core principles: first that the concepts that are covered are fundamental building blocks for understanding chemistry and second that the concepts should be perceived by the students as being directly applicable to their interests and careers. The authors further provide this core coverage using 1 of 3 models: data driven chemical theories and student understanding which allows for a more concrete foundation on which students build conceptual understanding.
