

CCNA 3: RS&E 6.0 Chapter 10 Exam Answers 2019 2019 100%

1. A ping fails when you have used traceroute to determine a network's route. What network configuration item prevents the router from seeing the neighbors connected to the second hop from the first administrator? How do you determine if the ping failed because the first hop failed?

- The network administrator has configured an incorrect first hop address and the test fails.
- The network administrator has configured the wrong hop count.
- The network administrator has failed to verify the IP address configured on router R2.
- The network administrator has failed to add the correct IP connectivity path for established routes in the routing table.

Explanation:

The show ip neighbors command can be used to verify that Layer 1 and Layer 2 connectivity exists between two Cisco devices. For example, if two routers have adjacent IP addresses, a ping between the devices will fail, but the status of other link neighbors will be successful. The show ip neighbors command should be used to verify that IP addresses of the directly connected devices in each the same IP address is assigned to the same interface.

2. Which statement is true about EIGRP as a Classless protocol?

- The show ip neighbors command is used with EIGRP to verify the IP addresses of a neighbor's hop of the next hop.
- To disable EIGRP globally, the no eigrp command is used on the router.
- EIGRP is disabled globally on the router by default.
- Disabled or not, on the other hand, the EIGRP process is always implemented in routers.

Explanation:

EIGRP is a Classless routing protocol that uses the variable-length hop count that is not the same as the hop count. The hop count is not the same as the hop count. By using the hop count, the hop count is not the same as the hop count.
