Handbook of Differential Equations Daniel Zwillinger, 2014-05-12 Handbook of Differential Equations is a handy reference to many popular techniques for solving and approximating differential equations including exact analytical methods approximate analytical methods and numerical methods Topics covered range from transformations and constant coefficient linear equations to finite and infinite intervals along with conformal mappings and the perturbation method Comprised of 180 chapters this book begins with an introduction to transformations as well as general ideas about differential equations and how they are solved together with the techniques needed to determine if a partial differential equation is well posed or what the natural boundary conditions are Subsequent sections focus on exact and approximate analytical solution techniques for differential equations along with numerical methods for ordinary and partial differential equations This monograph is intended for students taking courses in differential equations at either the undergraduate or graduate level and should also be useful for practicing engineers or scientists who solve differential equations on an occasional basis

Computer Algebra Handbook Johannes Grabmeier, Erich Kaltofen, Volker Weispfenning, 2012-12-06 Two ideas lie gleaming on the jeweler's velvet The first is the calculus the second the algorithm The calculus and the rich body of mathematical analysis to which it gave rise made modern science possible but it has been the algorithm that has made possible the modern world David Berlinski The Advent of the Algorithm First there was the concept of integers then there were symbols for integers I II III 1111 fttt what might be called a sticks and stones representation I II III IV V Roman numerals 1 2 3 4 5 Arabic numerals etc Then there were other concepts with symbols for them and algorithms sometimes for manipulating the new symbols Then came collections of mathematical knowledge tables of mathematical computations theorems of general results Soon after algorithms came devices that provided assistance for carrying out computations Then mathematical knowledge was organized and structured into several related concepts and symbols logic algebra analysis topology algebraic geometry number theory combinatorics etc This organization and abstraction lead to new algorithms and new fields like universal algebra But always our symbol systems reflected and influenced our thinking our concepts and our algorithms

Handbook of Geometry and Topology of Singularities V: Foliations Felipe Cano, José Luis Cisneros-Molina, Lê Dũng Tráng, José Seade, 2024-06-05 This is the fifth volume of the Handbook of Geometry and Topology of Singularities a series which aims to provide an accessible account of the state of the art of the subject its frontiers and its interactions with other areas of research Singularities are ubiquitous in mathematics and science in general and singularity theory is a crucible where different types of mathematical problems converge surprising connections are born and simple questions lead to ideas which resonate in other parts of the subject and in other subjects This Volume V focuses on singular holomorphic foliations which is a multidisciplinary field and a whole area of mathematics in itself Singular foliations arise for instance by considering The fibers of a smooth map between differentiable manifolds with singularities at the critical points

The integral lines of a vector field or the action of a Lie group on a manifold The singularities are the orbits with special isotropy The kernel of appropriate 1 forms The singularities are the zeros of the form Open books which naturally appear in singularity theory as foliations with singular set the binding These important examples highlight the deep connections between foliations and singularity theory This volume like its companion Volume VI also focused on foliations consists of nine chapters authored by world experts which provide in depth and reader friendly introductions to some of the foundational aspects of the theory These introductions also give insights into important lines of further research The volume starts with a foreword by one of the current world leaders in the theory of complex foliations The book is addressed to graduate students and newcomers to the theory as well as to specialists who can use it as a guidebook **Feedback Control of Dynamic**

Bipedal Robot Locomotion Eric R. Westervelt, Jessy W. Grizzle, Christine Chevallereau, Jun Ho Choi, Benjamin Morris, 2018-10-03 Bipedal locomotion is among the most difficult challenges in control engineering Most books treat the subject from a quasi static perspective overlooking the hybrid nature of bipedal mechanics Feedback Control of Dynamic Bipedal Robot Locomotion is the first book to present a comprehensive and mathematically sound treatment of feedback design for achieving stable agile and efficient locomotion in bipedal robots In this unique and groundbreaking treatise expert authors lead you systematically through every step of the process including Mathematical modeling of walking and running gaits in planar robots Analysis of periodic orbits in hybrid systems Design and analysis of feedback systems for achieving stable periodic motions Algorithms for synthesizing feedback controllers Detailed simulation examples Experimental implementations on two bipedal test beds The elegance of the authors approach is evident in the marriage of control theory and mechanics uniting control based presentation and mathematical custom with a mechanics based approach to the problem and computational rendering Concrete examples and numerous illustrations complement and clarify the mathematical discussion A supporting Web site offers links to videos of several experiments along with MATLAB code for several of the models This one of a kind book builds a solid understanding of the theoretical and practical aspects of truly dynamic locomotion in planar bipedal robots *The Bookseller* ,1982 **Whitaker's Cumulative Book List** ,1980

Holomorphic Foliations with Singularities Bruno Scárdua, 2021-12-01 This concise textbook gathers together key concepts and modern results on the theory of holomorphic foliations with singularities offering a compelling vision on how the notion of foliation usually linked to real functions and manifolds can have an important role in the holomorphic world as shown by modern results from mathematicians as H Cartan K Oka T Nishino and M Suzuki The text starts with a gentle presentation of the classical notion of foliations advancing to holomorphic foliations and then holomorphic foliations with singularities The theory behind reduction of singularities is described in detail as well the cases for dynamics of a local diffeomorphism and foliations on complex projective spaces A final chapter brings recent questions in the field as holomorphic flows on Stein spaces and transversely homogeneous holomorphic foliations along with a list of open questions for further study and research Selected exercises at the end of each chapter help the reader to grasp the theory Graduate students in Mathematics with a special interest in the theory of foliations will especially benefit from this book which can be used as supplementary reading in Singularity Theory courses and as a resource for independent study on this vibrant field of research
