machines turn off the lights lock the door and the machine churns up the parts remains an unfulfilled dream Yet when we look at the enormity of the process of automation and integration even for the most simply conceived part factory we can recognize that automation has been applied and is being applied more so when it made sense from a cost benefit standpoint It is our nature to be dissatisfied with near term progress but when we realize how short a time the tools to do that automation have been available the progress is clearly noteworthy considering the multitudes of factors and the environment we have to deal with Most of the automation problems we confront in today's environment are multidisciplinary in nature They require not just the knowledge and experience in various distinct fields but good cooperation from different disciplined organizations to adequately comprehend and solve such problems In Volume III we have many examples that reflect the current state of the art techniques of robotics and plant automation The papers for Volume III have been arranged in a logical order of automation planning automated assembly robot programming and simulation control motion coordination communication and networking to factories of the future

Kinematic Modeling, Identification, and Control of Robotic Manipulators Henry W. Stone, 2012-12-06 The objective of this dissertation is to advance the state of the art in the kinematic modeling identification and control of robotic manipulators with rigid links in an effort to improve robot kinematic performance The positioning accuracy of commercially available industrial robotic manipulators depends upon a kinematic model which describes the robot geometry in a parametric form Manufacturing error in the machining and assembly of manipulators lead to discrepancies between the design parameters and the physical structure Improving the kinematic performance thus requires the identification of the actual kinematic parameters of each individual robot The identified kinematic parameters are referred to as the arm signature Existing robot kinematic models such as the Denavit Hartenberg model are not directly applicable to kinematic parameter identification In this dissertation we introduce a new kinematic model called the 5 Model which is applicable to kinematic parameter identification and use it as the foundation for our development of a general technique for identifying the kinematic parameters of any robot with rigid links
