

- **Folding:** when one or a stack of originally flat, level surfaces, such as sedimentary strata, are bent or curved as a result of pressure and high temperature. The basic cause is likely to be some aspect of plate tectonics.
 - Fold mountains are mountains that form mainly by the effects of folding on layers within the upper part of the Earth's crust.
- **Faulting:** crack in the Earth's crust. Typically, faults are associated with, or form, the boundaries between Earth's tectonic plates.
 - Fault-block mountains are formed by the movement of large crustal blocks when forces in the Earth's crust pull it apart. Some parts of the Earth are pushed upward and others collapse down.
 - **Fault-Block Mountains**

- **Volcanic Activity:** A volcanic eruption occurs when molten rock, ash and steam pour through a vent in the earth's crust. Volcanoes are described as active (erupting), dormant (not erupting at the present time), or extinct (having ceased erupting; no longer active).
 - A curved chain of volcanoes in the overriding tectonic plate of a subduction zone. Volcanic arcs form as the result of rising magma formed by the melting of the downgoing plate. They are curved because of the curvature of the Earth. The Andes mountains form a volcanic arc. See also island arc.
- **Igneous Intrusion:** An igneous intrusion (also called a dike or a plutonic formation) is a formation in which magma (molten rock) is trapped beneath the surface of the Earth and pushed the rock located above it into a dome shape. It has a flat base and a convex upper surface.
 - **Batholith:** a large, discordant, intrusive body of igneous rock.

- **Schistosity:**
 - Alteration of the composition or structure of a rock by heat, pressure, or other natural agency.
 - The deformation involved in the formation of foliated metamorphic rocks (generally involves compressional stresses). The result of compressional stress acting on rocks that behave in a ductile manner (as the behavior is favored by higher temperature, higher confining stress (pressure) and low strain rates) is the folding of rocks. Original bedding is folded into a series of antiforms and sometimes with fold axes perpendicular to the direction of maximum compressional stress.
