I. INTRODUCTION

Industrial ventilation generally involves the use of supply and exhaust ventilation to control emissions, exposures, and chemical hazards in the workplace. Traditionally, nonindustrial ventilation systems commonly known as heating, ventilating, and air-conditioning (HVAC) systems were built to control temperature, humidity, and odors.

1. Ventilation may be deficient in:
 - confined spaces;
 - facilities failing to provide adequate maintenance of ventilation equipment;
 - facilities operated to maximize energy conservation;
 - windowless areas; and
 - areas with high occupant densities.

Any ventilation deficiency must be verified by measurement.

- II.
 1. There are five basic types of ventilation systems:
 1. dilution and removal by general exhaust;
 2. local exhaust (see Figure III:3-1);
 3. makeup air (or replacement);
 4. HVAC (primarily for comfort); and
 5. recirculation systems.
