Between Human and Machine David A. Mindell, 2003-04-30 Today we associate the relationship between feedback control and computing with Norbert Wiener's 1948 formulation of cybernetics. But the theoretical and practical foundations for cybernetics, control engineering, and digital computing were laid earlier, between the two world wars. In *Between Human and Machine: Feedback Control and Computing before Cybernetics*, David A. Mindell shows how the modern sciences of systems emerged from disparate engineering cultures and their convergence during World War II. Mindell examines four different arenas of control systems research in the United States between the world wars: naval fire control, the Sperry Gyroscope Company, the Bell Telephone Laboratories, and Vannevar Bush's laboratory at MIT. Each of these institutional sites had unique technical problems, organizational imperatives, and working environments, and each fostered a distinct engineering culture. Each also developed technologies to represent the world in a machine. At the beginning of World War II, President Roosevelt established the National Defense Research Committee, one division of which was devoted to control systems. Mindell shows how the NDRC brought together representatives from the four pre-war engineering cultures and how its projects synthesized conceptions of control, communications, and computing. By the time Wiener articulated his vision, these ideas were already suffusing through engineering. They would profoundly influence the digital world. As a new way to conceptualize the history of computing, this book will be of great interest to historians of science, technology, and culture, as well as computer scientists and theorists. *Between Human and Machine: Feedback Control and Computing before Cybernetics*

Software Engineering 2 Dines Bjørner, 2007-08-01 The art/craft discipline, logic practice, and science of developing large-scale software products needs a professional base. The textbooks in this three-volume set combine informally engineeringly sound approaches with the rigor of formal mathematics-based approaches. This volume covers the basic principles and techniques of specifying systems and languages. It deals with modelling the semiotics, pragmatics, semantics, and syntax of systems and languages; modelling spatial and simple temporal phenomena; and such specialized topics as modularity, including UML class diagrams, Petri nets, live sequence charts, statecharts, and temporal logics, including the duration calculus. Finally, the book presents techniques for interpreter and compiler development of functional, imperative, modular, and parallel programming languages. This book is targeted at late undergraduate to early graduate university students and researchers of programming methodologies. Vol 1 of this series is a prerequisite text.
