

Probability & Statistics (Probability)

Unit – I

Trial (or) Random Experiment : Consider an experiment which, though repeated any number of times under essentially identical conditions, does not give unique results but may result in any one of the several possible outcomes. These experiments are called as a Trial (or) Random Experiment. And the outcomes are known as Events.

Example: 1. Throwing a die is a trial & getting result (1 or 2 or 3 or 4 or 5 or 6) is an event.
2. Tossing a coin is a trial & getting result head or tail is an event.

Sample Space : The total number of possible outcomes in any trial is known as Sample space (or) Exhaustive Events & it is denoted by 'S'.

Example: 1. In tossing a coin, there are two exhaustive cases that are head & tail.
2. In throwing of a Die, there are six exhaustive cases. Since any one of the 6 faces 1, 2, 3, 4, 5, 6 may come on upper face.
3. In drawing two cards from a pack of 52 cards, the exhaustive number of cases is $52C_2$.
4. In throwing of two dice, the exhaustive number of cases is $6^2 = 36$
5. In throwing of 'n' dice, the exhaustive number of cases is 6^n

Note : 1. An event $E_1 = S$, then the event E_1 is called as Sure (or) Certain Event.
2. If $E_2 = \Phi$, then the event E_2 is called as Impossible event.

Equally likely events : Outcomes of a trial are said to be equally likely if there is no reason to expect one of them in preference to others.

Example : 1. In tossing an un-biased coin, the two possible cases head or tail are equally likely events.
2. In throwing an un-biased die, all the six faces are equally likely events.

Mutually Exclusive Events : Events are said to be mutually exclusive or incompatible if the happening of any one of them precludes the happening of all others .
i.e., If no two or more of them can happen simultaneously in the same trial.

Example : 1. In tossing a coin the events Head & tail are mutually exclusive.
2. In throwing a die all 6 possible cases are mutually exclusive.

Note : If two events are mutually exclusive, then the sets are disjoint.
i.e., Let A & B are two non-empty sets are said to be mutually exclusive if $A \cap B = \Phi$

Favorable Events : The number of cases favorable to an event in a trial is the number of outcomes which entail the happening of the event.

Example: 1. In throwing of two dice, The number of favorable cases for getting the sum of the results of the two dice 5 is 4. { (1,4), (4,1), (2,3), (3,2) }
2. In drawing a card from a pack of 52 cards,
The number of favorable cases for drawing an Ace is 4.
The number of favorable cases for drawing a spade is 13.
The number of favorable cases for drawing a red card is 26.

Classical (or Mathematical) Definition of Probability :

If a trial results in 'n' exhaustive, mutually exclusive & equally likely cases and 'm' of them are favorable to happening of an event E, then the Probability of occurrence of event E is denoted by P(E) & is defined as

Methods For Monitoring Tiger And Prey Populations K. Ullas Karanth,James D. Nichols,2017-10-26 This book addresses issues of monitoring populations of tigers ungulate prey species and habitat occupancy with relevance to similar assessments of large mammal species and general biodiversity It covers issues of rigorous sampling modeling estimation and adaptive management of animal populations using cutting edge tools such as camera traps genetic identification and Geographic Information Systems GIS applied under the modern statistical approach of Bayesian and likelihood based inference Of special focus here are animal survey data derived for use under spatial capture recapture occupancy distance sampling mixture modeling and connectivity analyses Because tigers are an icons of global conservation in last five decades enormous amounts of commitment and resources have been invested by tiger range countries and the conservation community for saving wild tigers However status of the big cat remains precarious Rigorous monitoring of surviving wild tiger populations continues to be essential for both understanding and recovering wild tigers However many tiger monitoring programs lack the necessary rigor to generate the reliable results While the deployment of technologies analyses computing power and human resource investments in tiger monitoring have greatly progressed in the last couple of decades a full comprehension of their correct deployment has not kept pace in practice In this volume Dr Ullas Karanth and Dr James Nichols world leaders in tiger biology and quantitative ecology respectively address this key challenge The have collaborated with an extraordinary array of 30 scientists with expertise in a range of necessary disciplines biology and ecology of tigers prey and habitats advanced statistical theory and practice computation and programming practical field sampling methods that employ technologies as varied as camera traps genetic analyses and geographic information systems The book is a tour de force of cutting edge methodologies for assessing not just tigers but also other predators and their prey The 14 chapters

here are lucidly presented in a coherent sequence to provide tiger specific answers to fundamental questions in animal population assessment why monitor what to monitor and how to monitor While highlighting robust methods the authors also clearly point out those that are in use but unreliable The managerial dimension of tiger conservation described here the task of matching monitoring objectives with skills and resources to integrate tiger conservation under an adaptive framework also renders this volume useful to wildlife scientists as well as conservationists
