

Answer Key

Unit 5 Population Dynamics

Answers to Unit Preparation Questions Assessing Student Readiness

(Student textbook pages 492–5)

1. A population is a group of organisms of one species that lives in the same place, at the same time, and can successfully reproduce, but a community refers to the populations of all the species that interact in a certain area.
2. c
3. Both ecosystems are aquatic. The main difference between the two ecosystems is that eels hatch, spawn and die in an ocean-based saltwater environment but live much of their lives in an inland freshwater environment. Each of these environments has different water conditions and provides different food sources.
4. a. True
b. False, carnivorous plants would not do well in conditions to which they are not well-adapted.
c. False, two or more species cannot occupy the same ecological niche.
5. d
6. a. Amount of sunlight, temperature range, and amount of precipitation.
b. Predatory insects, organisms that cause disease or that are parasitic, and competition for nutrients, space, and sunlight.
7. Each type of fish is a separate population in Lake Superior. Together, all of the fish make a community.
8. c
9. b
10. Sample caption: Fungi absorb nutrients from dead organisms on the forest floor.
11. If a keystone species is removed from an ecosystem, the ecosystem is harmed because the food web is disrupted. The balance in the ecosystem no longer exists and the ecosystem can collapse.
12. a. The hawk is a predator and the frog is the prey.
b. bunchgrass
c. spotted frog
d. grasshopper
e. energy
f. four
13. Decomposers would appear at each trophic level as they would extract energy from each organism when it dies.
14. a. No, because it is commonly accepted that less than 10% of available energy is transferred from one trophic level to the next.
b. Each organism uses much of the energy it consumes for its biological processes and some energy is transferred to the environment in the form of heat.
15. On average, only about 10 percent of the energy available at one trophic level is available to consumers at the next trophic level. Animals that make up the highest trophic level in any food web tend to be large, predatory species such as bears, lions, whales, and eagles. Since there is less biomass (and therefore less energy) from lower to higher trophic levels, there can only be a few of these large animals in any ecosystem compared with much larger numbers of organisms such as deer at lower trophic levels, where biomass and food energy is more plentiful.
16. Webs should include producers and a number of primary, secondary, and tertiary consumers, linked appropriately.
a. Freshwater lakes contain many omnivorous species. Producers might include algae, (some) bacteria, diatoms, and *Daphnia*. Primary consumers might include zooplankton and larvae of fish or amphibians. Secondary consumers might include insects, small fish, and frogs. Tertiary consumers might include large fish, predatory birds, and humans. Each level should be linked to decomposers (i.e., certain bacteria).
b. Forest webs should include distinct herbivores and carnivores/omnivores. Producers might include grasses, shrubs, trees, and wildflowers. Primary consumers might include forest herbivores such as bears, moose, deer, elk, rabbits, insects (grasshoppers), birds (seed eaters), small rodents (e.g., squirrels, chipmunks), and beaver. Secondary consumers might include insect- and rodent-eating birds (e.g., flycatchers, owls, hawks), weasels, foxes, and raccoons. Tertiary consumers might include
