

Figure 2. Computerized Control Panel

If a problem with the capacity control system is suspected, the PowerSync software provides for testing these groups for proper operation. (Reference COMPRESSOR MAINTENANCE MENU 2 on page 41.)

👉 NOTICE!

Troubleshooting the capacity control system can be done with the compressor to be tested supplying compressed air to the system but it is recommended that the compressor be isolated from the plant air system to avoid disruption of the air supply and variations in system pressure during testing.

The PowerSync aircord and controller have been designed to work together to provide the best full-load and part-load efficiencies available in the compressor industry.

Besides providing outstanding single machine efficiencies, PowerSync includes multi-machine control that uses logic based on system and compressor capacity demands to provide optimal utilization of your compressor equipment.

For applications that may be able to use base-load compressors without variable capacity control, the computerized controller can be ordered with standard QSI or QS2 compressors and used in a network with other PowerSync compressors.

NOTICE!

Reference "Fluid Carryover" (pages 9-11) for special considerations when using the computerized controller with standard QSI compressors.
