**Abstract**—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were randomly assigned to a control group (CON) and an exercise group (EX). The EX group performed a 12-week training program consisting of three sessions per week of aerobic and resistance training. The CON group remained sedentary. The EX group showed a significant increase in HR and EE compared to the CON group. The results suggest that a 12-week training program can improve cardiovascular fitness and increase energy expenditure in sedentary, middle-aged women.

If you are not satisfied with your results, follow the instructions carefully and test your original article. If the editor still requests the (a) paragraph and (b) and (c) paragraphs, repeat the analysis with the original data and the original results.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light in commercial greenhouses. Likewise, plants are flowering the opposite way (e.g., in the middle of the night).
- Increased moisture in the soil will compete with the salt for absorption by the roots. The length of the growing season may be extended by the use of plastic mulch and irrigation.
- The soil pH can be adjusted by the use of lime to change the growing conditions. The growing medium is usually a peat-based, sterile substrate for these plants and is usually heavy. Sand can be added to the mix (about a 1:1 ratio).
