**Biomimetic Materials for Tissue Regenerations, 2nd edition** Mariappan Rajan, Stevo J. Najman, Naresh Kumar Rajendran, 2022-10-20 In tissue engineering the ultimate goal is to engineer an entire functioning organ that requires building complex structures of different tissue types A three dimensional scaffold seeded with desired cell types In order to resemble the natural formations of the organs cells have to be correctly located in relation to one another It has been shown in cocultures that cells have the capability of spontaneous tissue like organization when seeded into the scaffold The ideal scaffolds should have an interconnected porous structure well designed pore size and adequate porosity to allow cell attachment proliferation and differentiation Moreover effective bioactive agents and nutrient exchange are crucial during new tissue development Thus the individual organ cell is a specific mechanism for the construction or regeneration of the cells Artificial scaffolds have been applied and used as supporting structures for cell cultures as well as for the domination of cell growth in the repair of impaired tissues or organs During the cell regeneration the scaffold temporarily helps in cell regeneration and gradually biodegrade either in the course of the healing process or after and a new tissue with a desired shape and properties is produced The challenge of tissue engineering is to mimic what happens in nature Attempts are being made to engineer in vitro practically every tissue and organ in the body Work is proceeding in creating tissue engineered liver nerve kidney intestine pancreas and even heart muscle and valves In the area of connective tissues work has been ongoing worldwide for many years in the engineering of tendon ligament bone and cartilage Recently the number of reports was succeeded in skin bladder airway and bone where tissue engineered constructs have been used successfully in patients This Research Topic is the collection of body organ regeneration materials and their cell adhesion and migration for the development and regeneration of tissues Biomimetic materials promise to advance in current understanding of organ regeneration and repair by providing tools to recapitulate and monitor relevant properties of cellular microenvironment interactions Although cell adhesion migration and development aspects of tissues have shown success in the clinic better more intricate models are needed to understand drivers of tissue repair and regeneration fully Tissue engineering bears tremendous potential toward gaining a complete understanding of the underlying biological and physical mechanisms advancing the treatment of damaged organs The following Research Topic Bio mimetic materials for tissue regenerations discusses examples of progress toward this objective Bio mimicking scaffold materials for tissue regeneration Cell adhesion to scaffold materials Role of materials for the migration of cells Mechanisms of cell growth for organ development
