

Respiratory system and gas exchange

In humans, air enters the nasal cavity and is moistened, warmed, and filtered. From there air passes to pharynx then through the larynx and down the trachea and bronchi into the tiniest bronchioles which end in microscopically tiny air sacs called alveoli (air sac). Here diffusion of respiratory gases occurs.

Gas exchange process:

Humans have an internal respiratory surface because respiratory gases are exchanged deep inside the body. The rib cage expands and the diaphragm contracts and move downward, thus expanding the chest cavity and decreasing the internal pressure.

Air is drawn into the lungs by **negative pressure** because the internal pressure inside the chest cavity is lower than the air pressure surrounding the body.
