Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 10 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or other medical problems. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of 30 minutes of moderate-intensity aerobic exercise. The control group consisted of 10 women who did not exercise. The subjects were monitored for HR and EE at baseline and at the end of the 10-week training program. The results showed that the training program had a significant effect on HR and EE. The HR of the training group decreased significantly from baseline to the end of the 10-week training program. The EE of the training group increased significantly from baseline to the end of the 10-week training program. The control group showed no significant changes in HR or EE. The results of this study suggest that a 10-week training program can improve the cardiovascular fitness and energy expenditure of sedentary, middle-aged women.
