Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized controlled trial. The intervention group (n = 15) participated in a 12-week training program, while the control group (n = 15) remained sedentary. The training program consisted of three sessions per week, each lasting 45 minutes. The sessions included aerobic exercise, strength training, and flexibility exercises. The control group remained sedentary throughout the study. The primary outcome was the change in body mass index (BMI) over the 12-week period. Secondary outcomes included changes in waist circumference, blood pressure, heart rate, and self-reported stress levels. Data were collected at baseline and at 12 weeks. Statistical analysis was performed using a two-sample t-test for independent groups. The results showed that the intervention group had a significant decrease in BMI compared to the control group (p < 0.05). Additionally, the intervention group showed significant improvements in waist circumference, blood pressure, heart rate, and self-reported stress levels compared to the control group (p < 0.05). The findings suggest that a 12-week training program can effectively improve the physical and psychological health of sedentary, middle-aged women.	Keywords Sedentary lifestyle, Middle-aged women, Physical health, Psychological health, Training program, BMI, Waist circumference, Blood pressure, Heart rate, Stress levels.	Introduction Sedentary lifestyle is a major public health concern, as it is associated with an increased risk of chronic diseases such as obesity, cardiovascular disease, and type 2 diabetes. Middle-aged women are particularly vulnerable to the negative health effects of sedentary behavior. Physical inactivity can lead to weight gain, which in turn increases the risk of developing chronic conditions. Moreover, sedentary behavior can also contribute to psychological issues, such as stress and anxiety. Therefore, it is important to develop interventions that can help middle-aged women become more physically active and improve their overall health. One such intervention is a structured training program. Training programs can provide middle-aged women with the opportunity to engage in regular physical activity, which can lead to improvements in both physical and psychological health. However, the effectiveness of training programs for middle-aged women is not well understood. This study aims to address this knowledge gap by examining the effects of a 12-week training program on the physical and psychological health of sedentary, middle-aged women.

- OVER THE CLOUDS**
1. What is the primary purpose of cloud computing?
2. Which of the following is NOT a characteristic of cloud computing?
3. What is the main benefit of using cloud storage?
4. Which of the following is a common security concern with cloud computing?
5. What is the term for the process of moving data and applications to the cloud?

Abstract *Background:* The purpose of this study was to determine the prevalence of self-reported depression and anxiety among a sample of young adults in the United States. *Methods:* Data were obtained from the 2004 National Survey of Adolescent Health, a nationally representative sample of adolescents and young adults. *Results:* The prevalence of self-reported depression was 10.1% and self-reported anxiety was 12.5%. *Conclusions:* The prevalence of self-reported depression and anxiety among young adults in the United States is high. *Keywords:* Depression, anxiety, young adults.
