*Microtextures of Igneous and Metamorphic Rocks* J.P. Bard, 2012-12-06 At a time when textural evidence is regarded as being obvious it becomes more and more difficult to find illustrations or even descriptions of the arrangements of the various constituents of metamorphic rocks It is helpful in consequence to advise geology students that the study of thin sections is not only concerned with the identification of their mineral content To do so would mean they could not see the wood for the trees Accurate identification of the individual minerals that form rocks is fundamental in their description but the analysis of their textures and habits is also essential Study of textural features enforces constraints upon the interpretation of the origin and history of a rock The analysis of micro textures cannot and should never be an aim in itself out must be supported by qualitative and quantitative correlations with theories of petrogenesis The aim here is to help the reader to bridge the gap between his observations of rocks under the microscope and petrogenetic theories The habits or architectures of crystals in rocks may resemble those studied by metallurgists and glass scientists Analysis of micro textures is undergoing change engendered by comparison between manufactured and natural minerals This can be seen from the increased number of publications dealing with crystal growth or deformation processes at microscopic scales to which the name of nanotectonics has been applied
