

The image displays a comprehensive periodic table of elements, color-coded by groups and periods. The elements are arranged in a grid, with each cell containing the element's symbol, atomic number, and name. The table is divided into several color-coded blocks: s-block (red), p-block (yellow), d-block (blue), f-block (green), and g-block (purple). A central diagram shows the periodic table with the following labels: s-block, p-block, d-block, f-block, and g-block. The periodic table is organized into groups (columns) and periods (rows). The groups are labeled with numbers 1 through 18, and the periods are labeled with numbers 1 through 7. The elements are arranged in a way that shows their chemical and physical properties, with elements in the same group having similar properties and elements in the same period having similar properties.

Deciphering the Chemical Code N. D. Epiotis, 1996. This groundbreaking work, the culmination of more than 10 years of research, presents a breakthrough theory of chemical bonding across the periodic table. Professor Epiotis, an internationally known and respected member of the theoretical community, challenges the conventional chemical concepts that underlie popular theories of chemical bonding. Building on his insight that electron-electron repulsion is the single crucial variable that differentiates one chemical system from another, the author formulates, explains, and applies a new approach based on nonorthogonal valence bond methodology that amounts to nothing less than a revolutionary unified theory of chemical bonding across the periodic table. This work represents the first post-Pauling theory of chemical bonding. New theory means new formulae, and this work is about new chemical formulae that lead to the self-consistent rationalization of existing facts and even more important, the design of new chemistry.
