Prakash,2009-11-16 The management of services and operations in today s organizations are coming increasingly dependent

on their enterprise local area network enterprise LAN An enterprise LAN consists of a set of network zones logical group of network elements corresponding to different departments or sections connected through various interface switches typically Layer 3 switches The network service accesses between these zones and also with the external network e.g Internet are governed by a global network security policy of the organization This global policy is defined as a collection of service access rules across various network zones where the services referred network applications conforming to TCP/IP protocol For example some of the known network services are ssh, telnet, http etc In reality the security policy may be incompletely specified which explicitly states the permit and deny access rules between specific network zones keeping remaining service access paths as unspecified The global security policy is realized in the network by configuring the network interfaces with appropriate sets of access control rules ACLs One of the major challenges in network security management is ensuring the conformation of the distributed security implementations with the global security policy

Trusted Execution Environments Carlton Shepherd, Konstantinos Markantonakis, 2024-06-26 Trusted execution environments TEEs protect sensitive code and data on computing platforms even when the primary operating system is compromised Once a technical curiosity TEEs have rapidly become a key component in securing numerous systems from cloud servers to constrained devices Today TEEs have been deployed on billions of devices for protecting financial payments personal files copyrighted media content and many others Despite this TEEs remain poorly understood due to their complexity and diversity This book addresses this gap providing a comprehensive treatment of different TEE technologies their features benefits and shortcomings A holistic view of secure and trusted execution is taken examining smart cards and CPU protection rings before discussing modern TEEs such as Intel SGX and ARM TrustZone A wide range of paradigms for building secure and trusted execution environments are explored from dedicated security chips to system on chip extensions and virtualisation technologies The relevant industry standards and specifications are covered in detail including how TEEs are evaluated and certified in practice with respect to security Several case studies are presented showing how TEEs are used in some common security mechanisms such as secure boot sequences biometric authentication and file based encryption This book also discusses present challenges in the field covering potential attack vectors against TEEs and concerns relating to fragmentation interoperability and transparency Lastly a selection of future directions are examined that may be used by the trusted execution environments of tomorrow This book is particularly targeted at practitioners and researchers in cyber security such as penetration testers security engineers and security analysts Additionally this book serves as a valuable resource for university students both postgraduate and advanced undergraduates and professors in computer science and electrical engineering
