*Biodiversity and Conservation of Woody Plants* M. R. Ahuja, S. Mohan Jain, 2017-11-21 This book provides complete comprehensive and broad subject based reviews for students teachers researchers policymakers conservationists and NGOs interested in the biodiversity and conservation of woody plants Forests cover approximately 31 percent of the world's total landmass 93 percent is natural forest and only 7 percent consists of planted trees Forest decline is progressing at an alarming rate worldwide In addition to human activities logging deforestation and exploiting forest lands for agriculture and industrial use a number of other factors including pests and diseases drought soil acidity radiation and ozone are cumulatively contributing to global forest decline The present situation forces us to focus on forest conservation strategies for the present and future Gene conservation and maintaining genetic diversity in forest ecosystems are crucial to the preservation of forest genetic resources This calls for integrated action to implement both the in situ on site preservation of forest stands and ex situ distant from the original site strategies for the conservation of woody plants genetic resources Selected priority areas include 1 assessing patterns of genetic diversity and threats 2 understanding the biological processes regulating genetic diversity 3 assessing the impact of human activities and climate change on genetic diversity and 5 finding methods for prioritizing species and populations for the conservation of forest trees genetic resources All chapters were written by leading scientists in their respective fields which include woody plant diversity ecology and evolution assessment of genetic diversity in forest tree populations conservation planning under climate change and in situ and ex situ strategies including biotechnological approaches for the conservation of woody plants genetic resources

**Marine Biodiversity of Costa Rica, Central America** Ingo S. Wehrtmann, Jorge Cortés, 2008-12-28 Life began in the sea and even today most of the deep diversity of the planet is marine This is often forgotten especially in tropical countries like Costa Rica renowned for their rain forests and the multitude of life forms found therein Thus this book focusing on marine diversity of Costa Rica is particularly welcome How many marine species are there in Costa Rica The authors report a total of 6 777 species or 3.5% of the world's total Yet the vast majority of marine species have yet to be formally described Recent estimates of the numbers of species on coral reefs range from 1.9 million so that the true number of marine species in Costa Rica is certainly far higher In some groups the numbers are likely to be vastly higher because to date they have been so little studied Only one species of nematode is reported despite the fact that it has been said that nematodes are the most diverse of all marine groups In better studied groups such as mollusks and crustaceans reported numbers are in the thousands but even in these groups many species remain to be described Indeed the task of describing marine species is daunting if there really are about 9 million marine species and Costa Rica has 3.5% of them then the total number would be over 300 000 Clearly so much remains to be

done that new approaches are needed Genetic methods have enormous promise in this regard

institutions are different they believe their experiences can provide guidance to others who want to change their general education curriculum or who are being asked to teach core or general education courses in new ways The book also includes short essays by a number of faculty colleagues who have been teaching in BC s new innovative core courses providing practical advice about the challenges of trying interdisciplinary teaching team teaching project or problem based learning intentional reflection and other new structures and pedagogies for the first time It will also address some of the nuts and bolts issues they have encountered when trying to create structures to make curriculum change sustainable over time and to foster ongoing innovation

**Aquatic Biodiversity II** H. Segers, K. Martens, 2006-01-20 Freshwater Biodiversity is a much underestimated component of global biodiversity both in its diversity and in its potential to act as models for fundamental research in evolutionary biology and ecosystem studies Freshwater organisms also reflect quality of water bodies and can thus be used to monitor changes in ecosystem health The present book comprises a unique collection of primary research papers spanning a wide range of topics in aquatic biodiversity studies and including a first global assessment of specific diversity of freshwater animals The book also presents a section on the interaction between scientists and science policy managers A target opinion paper lists priorities in aquatic biodiversity research for the next decade and several reactions from distinguished scientists discuss the relevance of these items from different points of view fundamental ecology taxonomy and systematics needs of developing countries present day biodiversity policy at European and at global scales It is believed that such a platform for the interaction between science and science policy is an absolute necessity for the efficient use of research budgets in the future
